See Figure 801, Figure 802, Figure 803, Figure 804, Figure 805, Figure 806, Figure 807, Figure 808 and Figure 809.

(1) To ensure consistency and to eliminate confusion in reports or inspection standards, use nomenclature for various components of the inner and outer combustion chamber assembly as shown in Figure 801, Figure 802, Figure 803, and Figure 805.

(2) As an aid to documenting and maintaining inspection records, Figure 807, Figure 808 and Figure 809 are included. Copies may be made and used for documenting inner and outer combustion chamber assembly distress for ready reference and communications.

C. Definitions Of Terms

(1) Following terms are used in describing inner and outer combustion chamber assembly borescope distress and related limits.

(a) Burned or missing material - an area in which a louver is discolored, distorted, or louver lip material is missing as a result of burning.

(b) Burn streak - an axial series of louvers exhibiting burning and missing material.

(c) Hole - an area in which complete penetration of combustion chamber wall has resulted from material being burned away. Holes normally appear in burn streak.

(d) See Figure 804, Figure 805, and Figure 806 for definition of terms axial, radial, and circumferential for inner and outer combustion chamber assemblies.

D. Inner And Outer Combustion Chamber Assembly Limits

(1) Borescope inspection limits are presented in tabular form, including all items for distress interpretation.

(2) Distress limits in the following Table 801 are based upon considerations of inner and outer combustion chamber assembly durability and component integrity only. If inner and outer chamber assemblies are allowed to distress to absolute maximum levels of reduced inspection intervals, part reparability could be affected. This data consists of deterioration and damage limits as follows:

(a) The inner and/or outer combustion chamber assembly is acceptable for continued service but with regular borescope inspection interval.

(b) The inner and/or outer combustion chamber assembly is acceptable for continued service but with a reduced borescope inspection interval. Chambers which have reached a level of distress exceeding regular inspection intervallimits may be continued in service by employing this reduced inspection interval, until distress level reaches one or more of conditions listed under this category.

(c) The inner and/or outer combustion chamber assembly should be replaced, with service use terminated. Combustion chamber assemblies exhibiting distress exceeding reduced inspection interval limits must be removed from service. Engines in this category may be operated for a maximum of five additional cycles in order to reach a repair facility. It is expected that if distress exceeds these limits, discretionary judgement will be exercised in continuing engine operation for the additional five cycles.

(d) Limits and conditions pertaining to the inner and outer combustion chamber assembly are addressed in Table 801.

		CONTINUE-IN-SERVICE LIMITS	
INSPECTION AREA	OBSERVED CONDITION	REGULAR INTERVAL INSPECTION	REDUCED INTERVAL INSPECTION
Inner Combustion Chamber Assembly and Outer Combustion Chamber Assembly, Except Bulkhead	Burn-through (Open holes)	See Figures 810 and 811	See Figures 810 and 811
		1. Maximum of four burn-through holes each assembly.	1. Maximum of six burn-through holes each assembly.
		2. Largest dimension of each hole may not exceed 0.500 inch (12.700 mm) or 0.19 square inch (123. mm^2)	2. Largest dimension of each hole may not exceed 0.500 inch (12.700 mm) or 0.19 square inch (123. mm^2)
		3. Burn-through holes must be separated by a minimum of 6 inches (152.400 mm) of	3. Burn-through holes must be separated by a minimum of 6 inches (152.400 mm) of

Combustion Chamber Area Borescope Inspection/Distress Limits
Table 801

		CONTINUE-IN-SERVICE LIMITS	
INSPECTION AREA	OBSERVED CONDITION	REGULAR INTERVAL INSPECTION	REDUCED INTERVAL INSPECTION
(CONTINUED)		sound material. (Axially and/or circumferentially)	sound material. (Axially and/or circumferentially)
	Burning, Distortion, Missing Louver Lips Material, Burn-streak	See Figure 812	See Figure 812
		1. Unlimited amount of burning distortion and missing louver lip material is permitted circumferentially on each louver provided other limits are not exceeded.	1. If more than three axially successive louvers exhibit significant distress, a burn-streak is developing. This burn-streak should be monitored according to burn-hole size, crack length and crack intersection limits. If these limits are exceeded the assembly should be removed.
		2. Significant distress appearing axially on three successive louvers	

Combustion Chamber Area Borescope Inspection/Distress Limits
Table 801 (Continued)

		CONTINUE-IN-SERVICE LIMITS	
INSPECTION AREA	OBSERVED CONDITION	REGULAR INTERVAL INSPECTION	REDUCED INTERVAL INSPECTION
(CONTINUED)		and limited to three successive louvers (indicates development of burn-streak).	
	Burning (Burned Areas), Missing Material Or Coating Depletion	See Figure 811 and Figure 812 1. Unlimited on each louver to burn-through or burn-streak limits. NOTE: If significant distress or missing material is found particularly on the last louver, a thorough inspection of the downstream turbine airfoils is recommended.	
	Chipped Coating, Thermal Barrier Ceramic Coating Loss	See Figure 812 1. Unlimited on each louver, however, loss of coating may accelerate deterioration.	
	Louver lip (gap) closure and burning exceeded.	See Figure 812 1. Unlimited, provided burn-through limits are not exceeded. However, excessive closure will accelerate	

Combustion Chamber Area Borescope Inspection/Distress Limits
Table 801 (Continued)

		CONTINUE-IN-SERVICE LIMITS	
INSPECTION AREA	OBSERVED CONDITION	REGULAR INTERVAL INSPECTION	REDUCED INTERVAL INSPECTION
(CONTINUED)		down-stream deterioration.	
	Bent, Buckled Or Distorted Louvers	See Figure 812 1. Unlimited on each louver provided other limits are not exceeded.	
	Individual Axial Cracks	See Figure 813	

NOTE: For axial cracks that enter combustion, dilution, ignitor holes. The diameter of the manufactured hole does not need to be added to determine the crack length until the crack is seen exiting from the opposite side of the hole.

		1. Unlimited number up to 0.75 inch (19.050 mm) long.	1. Cracks can completely traverse one louver. Maximum of 2 cracks every 6.0 inches (152.400 mm) of louver material. Cracks must be separated circumferentially by 0.75 inch (19.050 mm). 2. Cracks can completely traverse one louver. Maximum of 3 cracks every 6.0 inches (152.400 mm) of louver

Combustion Chamber Area Borescope Inspection/Distress Limits
Table 801 (Continued)

		CONTINUE-IN-SERVICE LIMITS	
INSPECTION AREA	OBSERVED CONDITION	REGULAR INTERVAL INSPECTION	REDUCED INTERVAL INSPECTION
(CONTINUED)			material. Cracks must be separated circumferentially by 1.5 inches (38.100 mm).
		If these limits are exceeded, contact Pratt & Whitney for reccommendation on disposition.	
		2. Cracks can completely traverse one louver, but must be separated cirumferentially by 6.0 inches (152.400 mm) minimum.	
		3. Cracks can completely traverse on OBL No. 9 (rear most) louver, but must be separated circumferentially by 2.5 inches (63.5 mm) minimum. On OLB No. 9 louver (rear most), the minimum separation of cracks must be 2.5 inches (63.5 mm).	

Combustion Chamber Area Borescope Inspection/Distress Limits
Table 801 (Continued)

INSPECTION AREA	OBSERVED CONDITION	CONTINUE-IN-SERVICE LIMITS REGULAR INTERVAL INSPECTION	 REDUCED INTERVAL INSPECTION
(CONTINUED)			
		NOTE: An individual crack is a crack confined to one louver.	
	Intersection Of Axial And Circumferential Cracks	See Figure 814	See Figure 814
		1. Intersection of individual or continuous axial cracks and circumferential cracks is not permitted unless the circumferential cracks are confined to the louver lip portion of the louver. Louver lip material missing as a result of such crack intersection is permitted. Maximum length of circumferential crack lip area is 2.0 inches (50.800 mm).	1. Intersection of individual or continuous axial cracks and circumferential cracks is not permitted unless the circumferential cracks are confined to the louver lip portion of the louver. Louver lip material missing as a result of such crack intersection is permitted. Maximum length of circumferential crack lip area is 2.0 inches (50.800 mm).

NOTE: Use the hot side inspection that follows only if a cold side inspection is not easily accessible. This inspection is used to find if a knuckle between two louvers is cracked by looking through a

Combustion Chamber Area Borescope Inspection/Distress Limits
Table 801 (Continued)

		CONTINUE-IN-SERVICE LIMITS	
INSPECTION AREA	OBSERVED CONDITION	REGULAR INTERVAL INSPECTION	REDUCED INTERVAL INSPECTION
(CONTINUED)			
	borescope at the inner (hot side) surface of the burner rather than the outer (cold side) surface.		
	NOTE: To use the inner surface inspection method, all cracked surfaces in the continuous axial crack must be inspected for crack width. If all the louver cracks are less than 0.060 inch (1.524 mm) wide, they should be classified as individual cracks. If 2 consecutive louvers have crack widths that are more than 0.060 inch (1.524 mm), it should be classified as a 2 louver crack. If 3 consecutive louvers have crack widths that are more than 0.060 inch (1.524 mm), it should be classified as a 3 louver crack. This same inspection method should also be used for cracks that extend more than 3 louvers.		
	NOTE: Cracks are classified as individual axial cracks if they do not go through the louver knuckle area. An outer (cold side) inspection is optional to check if the cracks go through the louver knuckle area. If the outer (cold side) inspection shows that the cracks do not go through the louver knuckle area, then cracks are classified as individual axial cracks.		
	Continuous Axial Cracks	See Figures 813 and 814 (Continuous axial cracks must be monitored with reduced time interval)	See Figures 813 and 814 1. Two louver crack, if the measured crack width on each of the adjacent louvers is greater than 0.060 inch (1.524 mm) wide, AND/OR

Combustion Chamber Area Borescope Inspection/Distress Limits
Table 801 (Continued)

		CONTINUE−IN−SERVICE LIMITS	
INSPECTION AREA	OBSERVED CONDITION	REGULAR INTERVAL INSPECTION	REDUCED INTERVAL INSPECTION
(CONTINUED)			the louver wall deformation or surface mismatch is greater than 0.060 inch (1.524 mm). Individual crack separation limits apply for two louver cracks. 2. Three louver crack, if the measured crack width on each of the three adjacent louvers is greater than 0.060 inch (1.524 mm) wide, AND/OR the louver wall deformation or surface mismatch is greater than 0.060 inch (1.524 mm). Three louver cracks must be separated cirumferentially by 20.0 inches (508.00 mm) minimum. 3. Four louver crack, if the measured

Combustion Chamber Area Borescope Inspection/Distress Limits
Table 801 (Continued)

		CONTINUE-IN-SERVICE LIMITS	
INSPECTION AREA	OBSERVED CONDITION	REGULAR INTERVAL INSPECTION	REDUCED INTERVAL INSPECTION
(CONTINUED)			crack width on each of the four adjacent louvers is greater than 0.060 inch (1.524 mm) wide, but less than 0.150 inch (3.810 mm) AND/OR the louver wall deformation or surface mismatch is greater than 0.060 inch (1.524 mm) but less than 0.150 inch (3.810 mm). Engine must be scheduled off wing within 40 hours. 4. Greater than three louver crack, engine must be removed immediately if the crack is greater than 0.150 inch (3.810 mm) wide AND/OR thelouver wall deformation or surface mismatch is greater than 0.150 inch

Combustion Chamber Area Borescope Inspection/Distress Limits
Table 801 (Continued)

INSPECTION AREA	OBSERVED CONDITION	CONTINUE-IN-SERVICE LIMITS REGULAR INTERVAL INSPECTION	CONTINUE-IN-SERVICE LIMITS REDUCED INTERVAL INSPECTION
(CONTINUED)			(3.810 mm).
		NOTE: As a burn streak develops, louver material distorts, cracks and/or burns away. Individual axial louver cracks may continue to propagate and, although axially askew, join together to form a continuous crack within the burn streak, which penetrates the liner wall.	
	Circumferential Cracks	See Figure 814 1. None permitted except in lip region 2. Maximum length of circumferential crack in lip region is 2.0 inches (50.800 mm).	See Figure 814 1. None permitted except in lip region
	Intersection Of Burn-Holes By Axial Cracks	Refer to Figure 810 Intersection of burn holes by axial cracks is permitted. The previously established burn-hole and crack length dimension should be applied separately. However, when defining crack length, the hole width should be considered as part of the overall crack length.	

Combustion Chamber Area Borescope Inspection/Distress Limits
Table 801 (Continued)

		CONTINUE-IN-SERVICE LIMITS	
INSPECTION AREA	OBSERVED CONDITION	REGULAR INTERVAL INSPECTION	REDUCED INTERVAL INSPECTION
Fuel Injector Guide Heat Shield	Cracks in Heat Shield Face	See Figure 815	See Figure 815
		1. Unlimited cracks less than 1/4 inch or 0.25 inch (6.350 mm) in length are permitted. Two cracks (per heat shield) maximum may progress completely across each face, but cracks (on both heat shields) must be separated by 45°. No intersecting cracks.	1. Unlimited cracks less than 1/4 inch or 0.25 inch (6.350 mm) in length are permitted. Two cracks (per heat shield) maximum may progress completely across each face, but cracks (on both heat shields) must be separated by 30°. No intersecting cracks.
	Heat Shield Face Erosion, Missing Material, And Burning	See Figure 815	See Figure 815
		1. Erosion and burning is permitted provided none of the impingement holes beneath the heat shield inner face are exposed when viewing the heat shield from the rear	1. Erosion and burning in the heat shield inner face is permitted to expose up to four impingement cooling holes beneath the heat shield inner face.

Combustion Chamber Area Borescope Inspection/Distress Limits
Table 801 (Continued)

		CONTINUE-IN-SERVICE LIMITS	
INSPECTION AREA	OBSERVED CONDITION	REGULAR INTERVAL INSPECTION	REDUCED INTERVAL INSPECTION
		2. Outer face erosion can extend 0.2 inch (5.08 mm) inward from outer face for 360 degrees.	2. Outer face erosion can extend inward to within 0.025 inch (0.635 mm) of inner rear for 360 degrees.
		3. Heat shield distortion and burning is permitted provided that the heat shield face erosion and crack limits are not exceeded. The resulting distress to the bulkhead must not exceed the bulkhead distress limits.	
	Magnesium Zirconate Coating Loss	See Figure 812	
		1. Any amount permitted; however, loss of coating will accelerate deterioration.	
Fuel Injector End Cap/Tip Heat Shield	1. Radial cracks	1. Any amount permitted. See Figure 817.	
	2. Circumferential cracks along the outer DIA	2. Any amount permitted. See Figure 817.	
	3. End Cap Material Liberation (segments broken away)	3. Any amount permitted. See Figure 817.

Table 801 (Continued)

E. Procedure

(1) Remove Lockwire or Safety Cable and Ferrules, plugs and gaskets from the six AP-8 borescope access ports located on the diffuser case assembly. See Figure 801 (Sheets 1 and 2) Inspection/Check-01A Task 72-00-00-990-010 .

NOTE: Borescope access port AP-9 may also be used if desired. Remove and install AP-9 plug per Inspection/Check-01E Task 72-00-00-210-017.

CAUTION: TEMPERATURES IN AREAS TO BE BORESCOPED SHOULD BE PERMITTED TO COOL TO BELOW 150°F (65.6°C) FOLLOWING ENGINE OPERATION. DAMAGE MAY RESULT TO BORESCOPE EQUIPMENT IF EQUIPMENT IS EXPOSED TO GASPATH OR METAL TEMPERATURES IN EXCESS OF 150°F (65.6°C). AS A GUIDE - IF ADJACENT CASES ARE TOO HOT TO TOUCH COMFORTABLY, INSPECTION SHOULD BE DELAYED.

(2) Insert borescope through port and inspect condition of inner combustion chamber assembly, outer combustion

chamber assembly, bulkhead, fuel injectors, and heat shields per step (3) inspection limits.

NOTE: Maximum borescope insertion depth and borescope limiting access hole diameter specifications for AP−8 and AP−9 borescope ports are provided in Table 801 (Sheet 3) Inspection/Check−01A Task 72−00−00−990−010.

(3) Inspection limits.

CAUTION: FOLLOWING LIMITS ARE APPLICABLE ON A CONTINUE−IN−SERVICE BASIS ONLY. LIMIT IS BASED ON PART STRUCTURAL REQUIREMENTS AND DOES NOT IMPLY THAT ENGINE PERFORMANCE, STABILITY, OPERATING LIMITS, OR PART REPARABILITY WILL BE MAINTAINED.

(a) Limits for conditions observed during borescope inspection of combustion area are provided in Table 801 and Figure 810 through Figure 817.

R (4) After you complete the borescope inspection, install
R the AP−8 plugs as follows: See Table 802.

R (a) Use a nylon brush to clean the old antigalling
R compound from the threads of each AP plug.

R (b) Apply a thin layer of new antigalling compound to
R the threads and to the plug head washer contact
R surface area, see Figure 818. See Table 802 for
R the necessary antigalling compound.

R NOTE: Do not use Engine Oil P03−001 on the AP
R plug threads.

R (c) If you apply more antigalling compound than
R is necessary to the plug, remove the unwanted
R compound with a rag or cloth.

R (d) Put a new gasket or washer on each AP plug. See
R Table 802 or the necessary gasket or washer.

R NOTE: Always use a new gasket or washer. Do not
R use an old gasket or washer.

R (e) Install the AP plugs and gaskets or washers in the applicable borescope boss on the engine. See Table 802 for the necessary AP plug and gasket or washer part numbers for each location. Use a standard socket drive extension and ratchet to turn each AP plug into the boss. Hand tighten the plug only with the ratchet wrench.

R (f) Use a standard torque wrench to torque the AP plugs. See Table 802 for the necessary torque specifications.

R (g) Safety all the AP plugs with Lockwire P05-289.

R	AP Number And Diffuser Case Location	Gasket PN	Plug PN	Plug Replacement Lubricant	Plug Torque lb-in. (N.m)
R	AP-8 1:30 o'clock	673049	50A725	P06-023 Silver Goop	40 - 50 (4.519 - 5.649)
R	AP-8 4:30 o'clock	673049	50A725	P06-023 Silver Goop	40 - 50 (4.519 - 5.649)
R	AP-8 6:00 o'clock	673049	50A725	P06-023 Silver Goop	40 - 50 (4.519 - 5.649)
R	AP-8 7:30 o'clock	673049	50A725	P06-023 Silver Goop	40 - 50 (4.519 - 5.649)
R	AP-8 9:00 o'clock	673049	50A725	P06-023 Silver Goop	40 - 50 (4.519 - 5.649)
R	AP-8 11:00 o'clock	673049	50A725	P06-023 Silver Goop	40 - 50 (4.519 - 5.649)

For Engines Equipped:

NOTE: If the high stage temperature sensor was removed to borescope through the (338°C) 11:00 o'clock port, reinstall per Section 71-00-41, Installation-04 (Task 71-00-41-450-004).

R (Task 72−00−00−210−020)

ENGINE GENERAL − INSPECTION/CHECK−01D

Task 72−00−00−210−029:

1. Perform Borescope Inspection Of Combustion Chamber Area (AP−8)

A. General

CAUTION: IT IS NOT RECOMMENDED THAT A LARGE QUANTITY OF PARTS CONTINUE IN SERVICE THAT ARE DAMAGED TO THE MAXIMUM LIMITS. IF THEY DO CONTINUE, DECREASED ENGINE PERFORMANCE AND DECREASED PART LIFE CAN BE THE RESULT. THE BORESCOPE DAMAGE LIMITS IN THIS PROCEDURE ARE CALCULATED FROM TESTING AND STRUCTURAL ANALYSIS SPECIFICATIONS.

(1) Use this borescope procedure to examine the combustion chamber area for damage.

B. Equipment And Materials Necessary

Standard Tools:
See Inspection/Check−01A (Task 72−00−00−990−011) for borescope equipment.

Consumable Materials:

Item No.	Designation
P05−289	Lockwire
P06−023	Thread Lubricant (PWA 36001 or PMC 9940)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	6	72−41−00/1/130A

C. Procedure

(1) Remove the six AP−8 access port plugs from the diffuser case as follows: See Figure 801.

NOTE: Table 801 shows more specifications for the plugs at location AP−8.

(a) Cut the safety wire and remove the safety wire from the plugs that will be removed.

(b) Use a standard 3/8 socket drive extension and a breaker bar or ratchet to remove the AP−8 plugs.

(c) Remove the six AP−8 plugs and gaskets for the examination of the combustion chamber assembly.

NOTE: Although there are six usable AP−8 plugs, it is not necessary to remove all six plugs for every combustion chamber borescope inspection. Remove the number of AP−8 plugs that are necessary to do a 100 percent inspection of the combustion chamber assembly.

(d) Discard all the old gaskets.

Access Port & (Stage)	Angular Location Clockwise From Rear	Gasket P/N	Plug P/N	Plug Thread Lubricant	Plug Torque lb−in. (N.m)
AP−8	45° (1:30 o'clock)	512640	50A725	P06−023	40 − 50 (4.519 − 5.649)
AP−8	127° (4:30 o'clock)	512640	50A725	P06−023	40 − 50 (4.519 − 5.649)
AP−8	172° (6:00 o'clock)	512640	50A725	P06−023	40 − 50 (4.519 − 5.649)
AP−8	225° (7:30 o'clock)	512640	50A725	P06−023	40 − 50 (4.519 − 5.649)
AP−8	277° (9:00 o'clock)	512640	50A725	P06−023	40 − 50 (4.519 − 5.649)
AP−8	338° (11:00 o'clock)	512640	50A725	P06−023	40 − 50 (4.519 − 5.649)

For Engines Equipped:

NOTE: If the high stage temp sensor was removed to borescope through the (338°C) 11:00 o'clock port, reinstall per Section 71−00−41, Installation−04.

Borescope Access Port (AP) Data
Table 801

CAUTION: THE TEMPERATURES IN THE AREA OF THE ENGINE TO BE EXAMINED WITH THE BORESCOPE MUST BE LESS THAN 150°F (65.6°C). DAMAGE CAN RESULT TO THE BORESCOPE EQUIPMENT IF THE GASPATH OR METAL TEMPERATURES ARE MORE THAN 150°F (65.6°C). IF YOU CAN COMFORTABLY TOUCH THE CASES ADJACENT TO THE BORESCOPE PORT, IT IS SAFE TO DO THE BORESCOPE INSPECTION.

(2) Carefully put a flexible borescope through each of the access ports (AP-8) for the examination of the combustion chamber assembly. See Figure 802.

NOTE: A flexible borescope is necessary for the borescope inspection of the combustion chamber. Since holes in the combustion liner do not exactly align with the AP-8 ports in the diffuser case. See Figure 802. Do not use a ridge borescope.

(3) Carefully examine the inner combustion chamber assembly liner segments for damage.

(4) Carefully examine the outer combustion chamber assembly liner segments for damage.

(5) Carefully examine the combustion chamber bulkhead segments for damage.

(6) Carefully examine the fuel injector end caps and guides for damage.

(7) Technical names for combustion chamber parts for this inspection procedure. Use the names shown when you write inspection reports to prevent errors. See Figure 803 (Sheets 1 and 2).

(a) Use the part names shown in the figures for all the different parts and shapes of the inner and outer combustion chamber assembly.

(b) See the figures for the specifications of the names of axial, radial, and circumferential for the inner and outer combustion chamber assemblies.

(8) Technical names for combustion chamber damage. Use the names that follow when you write about damage in inspection reports. See Figure 804 and Figure 805.

(a) Burned material is an area in which a louver is discolored, distorted, or liner segment material is not there.

(b) A burn streak is an axial damage area of liner segments with burned material and material that is not there.

(c) A hole is an area which has burned fully through a liner segment. Holes frequently occur with burn streaks.

(9) To help you measure the crack or damage length, use the figures that follow. These figures give combustion hole dimensions for reference. See Figure 806 and Figure 807.

(10) Permitted service damage limits for the combustion chamber assembly are as follows.

(a) Borescope inspection limits are shown in tabular form. See Table 802.

(b) The permitted service damage limits shown in Table 802 are calculated from structural analysis specifications only. If the parts are operated when damaged to the maximum limits, it is possible that the parts can not be repaired at overhaul.

(c) If the combustion chamber assembly is damaged to the Regular Inspection Interval limits (shown in Table 802) the engine can continue in service. This engine must have the combustion chamber examined again at the Regular Inspection Interval.

NOTE: See the Aircraft Maintenance Planning Document for the time limits for each type inspection interval.

(d) If the combustion chamber assembly is damaged to the Reduced Inspection Interval limits (half the Regular Inspection Interval) the engine can continue in service. This engine must have the combustion chamber examined again at the Reduced Inspection Interval.

(e) If the combustion chamber assembly is damaged to the Additional Reduced Inspection Interval limits (1/4 the Regular Inspection Interval) the engine can continue in service. This engine must have the combustion chamber examined again at the Additional Reduced Inspection Interval.

(f) If the combustion chamber assembly is damaged more than the Additional Reduced Inspection Interval limits, the engine can not continue in service. It is permitted to ferry the aircraft for a maximum of five cycles only to a repair station. This engine must be removed for repair of the combustion chamber assembly.

COMBUSTION CHAMBER PERMITTED DAMAGE LIMITS

EXAMINE	DAMAGE	DISPOSITION
Liner segments with combustion or igniter holes or igniter holes for cracks (with or without burning)	One axial crack for the full length of the segment and through a combustion or igniter hole. See Figure 808 (Sheets 1 and 2).	Permitted for Regular Inspection Interval.
	One axial crack with burning downstream of any combustion or igniter hole. The width of distress must be less than the diameter of the hole. See Figure 808 (Sheet 2).	Permitted for Regular Inspection Interval.
	Two axial cracks, each for the full length of the segment and through a combustion hole. Both cracks must be apart by one combustion hole without a crack. Two axial cracks, each for the full length of the segment through each igniter hole. See Figure 808 (Sheets 1 and 2).	Permitted for Reduced Inspection Interval.
	Two or more cracks downstream of a combustion or igniter hole. One crack goes from a combustion or igniter hole to the trailing edge and no other crack goes more than half the distance to the same	Permitted for Additional Reduced Inspection Interval.

Combustion Chamber Area Borescope Inspection Damage Limits
Table 802

COMBUSTION CHAMBER PERMITTED DAMAGE LIMITS

EXAMINE	DAMAGE	DISPOSITION
(CONTINUED)	combustion hole or trailing edge. See Figure 808 (Sheet 3).	
	For igniter segment, one axial crack with burning around and downstream of the hole. The width of the ditress must be less than 0.9 inch (22.86 mm). See Figure 808 (Sheet 2).	Permitted for Reduced Inspection Interval.
	For igniter segment, one axial crack with burning around and downstream of the hole. The width of the ditress must be less than 1.2 inch (30.480 mm). See Figure 808 (Sheet 2).	Permitted for Addition Reduced Inspection Interval.
	A crack in any area that goes in the direction to an other crack. The other crack goes 0.25 inch (6.35 mm) minimum distance to the first crack. Both cracks start from the same edge or combustion hole. See Figure 808 (Sheet 4).	Permitted for Additional Reduced Inspection Interval.
	A cracked piece of liner that is less than 0.3 inch (7.62 mm) on the longest side that could soon break off with continued use.	Permitted for Additional Reduced Inspection Interval.
	A cracked piece of liner that is more than 0.3 inch (7.62 mm) on the longest side that could soon break off with continued use.	Remove Engine in 5 Cycles Maximum or less.
Liner segments without combustion holes for cracks (with or without burning)	One axial crack for the full length of the segment. See Figure 808 (Sheet 4).	Permitted for Regular Inspection Interval.

Combustion Chamber Area Borescope Inspection Damage Limits
Table 802 (Continued)

COMBUSTION CHAMBER PERMITTED DAMAGE LIMITS

EXAMINE	DAMAGE	DISPOSITION
(CONTINUED)		
	One axial crack for the full length of the segment and a second crack that goes 1/2 the axial distance (or more) of the segment.	Permitted for Additional Reduced Inspection Interval.
	A crack in any area that goes in a direction to another crack. the other crack goes 0.25 inch (6.35 mm) minium distance to the first crack. Both cracks start from the same edge. See Figure 808 (Sheet 4).	Permitted for Additional Reduced Inspection Interval.
	A cracked piece of liner that is less than 0.3 inch (7.62 mm) on the longest side that could soon break off with contuied use.	Permitted for Additional Reduced Inspection Interval.
	A cracked piece of liner that is more than 0.3 inch (7.62 mm) on the longest side that could soon break off with continued use.	Remove Engine in 5 Cycles Maximum or less.
Outer liner segments for burn-back on the trailing edge, leading edge, or side edge of Rows 1 thru 6 and inner liner segments Rows 1 thru 6.	Burn-back area for an axial distance of 0.3 - 0.5 inch (7.6 - 12.7 mm) from the trailing edge, (measure to a not burned edge surface). See Figure 808 (Sheet 5).	Permitted for Reduced Inspection Interval.
	Burn-back area for an axial distance of 0.5 - 1.0 inch (12.7 - 25.4 mm) from the trailing edge, (measure to a not burned edge surface). Attachment posts may be visible, but not missing. See Figure 808 (Sheet 5).	Permitted for Additional Reduce Inspection Interval

Combustion Chamber Area Borescope Inspection Damage Limits
Table 802 (Continued)

COMBUSTION CHAMBER PERMITTED DAMAGE LIMITS

EXAMINE	DAMAGE	DISPOSITION
(CONTINUED)		
	Burn-back area for an axial distance of more than 1.0 inch (25.400 mm) from the edge, (measure to a not burned trailing edge surface). Attachment posts may be visible, but not missing. See Figure 808 (Sheet 5).	Permitted for 50 hour inspection interval.
	Burn-back has caused liner shell damage or missing an attachment post because of burn-back.	Remove Engine in 5 Cycles Maximum or less.
Outer liner segments for thermal barrier coating that is not there, (gone).	Any quantity of thermal barrier coating is permitted to not be there but can cause increased liner segment deterioration.	Permitted for Regular Inspection Interval.
Liner segments for surface burns or burn holes.	Any quantity of surface burn (but not burned through).	Permitted for Regular Inspection Interval.
	A burn hole larger than 0.25 inch (6.350 mm). See Figure 808 (Sheet 6).	Permitted for Reduced Inspection Interval
	A burn hole larger than 0.40 inch (10.16 mm) See Figure 808 (Sheet 6).	Permitted for Additional Reduced Inspection Interval.
	Burn holes and cracks that will soon cause a piece of material that is less than 0.3 inch (7.62 mm) on the longest side to break off with continued use. See Figure 808 (Sheet 6).	Permitted for Additional Reduced Inspection Interval.

Combustion Chamber Area Borescope Inspection Damage Limits
Table 802 (Continued)

COMBUSTION CHAMBER PERMITTED DAMAGE LIMITS

EXAMINE	DAMAGE	DISPOSITION
(CONTINUED)		
	Burn holes and cracks that will soon cause a piece of material that is larger than 0.3 inch (7.6 mm) on the longest side to break off with continued use.	Remove Engine in 5 Cycles Maximum or less.
	Surface burns or burn holes that cause liner shell damage or you can see an attachment post because of surface burns or burn holes.	Remove Engine in 5 Cycles Maximum or less.
Liner segments, bulkhead, and fuel injector guide cone for material that is not there, (gone/broken off).	Any material that is gone (broken off) now but was there at the last inspection interval.	Do a borescope inspection of the HPT Stage 1 vanes, Stage 1 and 2 blades for impact damage. (If the material was gone at the last inspection interval, it is not necessary to do the HPT borescope inspection again). If no damage is seen on the HPT, apply burn back or burn hole limits to each respective area.
Bulkhead segments for thermal barrier coating that is not there, (gone).	Any quantity of thermal barrier coating not there (gone) is permitted but can cause increased liner segment deterioration. See Figure 809 (Sheets 1 and 2).	Permitted for Regular inspection interval.

Combustion Chamber Area Borescope Inspection Damage Limits
Table 802 (Continued)

COMBUSTION CHAMBER PERMITTED DAMAGE LIMITS

EXAMINE	DAMAGE	DISPOSITION
Bulkhead segments for burning.	Any quantity of surface burn (but not a burn hole).	Permitted for Regular inspection interval.
Bulkhead segments for burnback on trailing edges, side edges, or edge of fuel injector hole.	Erosion on edges less than 0.500 inch (12.700 mm) in length by 0.100 inch (2.540 mm) in width.	Permitted for Regular inspection interval.
Bulkhead segments for burned holes.	Burn holes.	Permitted for Reduced inspection interval.
Bulkhead segments for cracks, (radial and circumferential).	Cracks less than 0.2 inch (5.08 mm) in length. See Figure 809 (Sheet 2).	Permitted for Regular Inspection Interval.
	Radial and circumferential cracks are permitted to a 0.50 inch (12.7 mm) maximum length and separated by 2.0 inches (50.8 mm). See Figure 809 (Sheet 2).	Permitted for Reduced Inspection Interval.
	A cracked piece of bulkhead segment that is less than 0.3 inch (7.62 mm) on the longest side that could break off with continued use. See Figure 809 (Sheet 2).	Permitted for Additional Reduced inspection interval.
	Cracks that will soon make a closed loop and cause a piece of material (larger than 0.3 inch (7.620 mm) on the longest side) to break off are not permitted. See Figure 809 (Sheet 2).	Remove Engine in 5 Cycles Maximum or less.

Combustion Chamber Area Borescope Inspection Damage Limits
Table 802 (Continued)

COMBUSTION CHAMBER PERMITTED DAMAGE LIMITS

EXAMINE	DAMAGE	DISPOSITION
Fuel injector guide cone for cracks.	Any number of cracks less than 0.1 inch (2.54 mm). A crack is not permitted to touch another crack. See Figure 809 (Sheet 2).	Permitted for Regular Inspection Interval.
	Any number of cracks less than 0.15 inch (3.81 mm). A crack is not permitted to touch another crack. See Figure 809 (Sheet 2).	Permitted for Reduced Inspection Interval.
Fuel injector guide cone for erosion, material that is not there, (gone) and burning.	Edge erosion can go 0.1 inch (2.54 mm) forward from the rear face, all around for 360°.	Permitted for Regular Inspection Interval.
	Edge erosion can go to a distance of 0.15 inch (3.81 mm) forward from the rear face, all around for 360°. See Figure 809 (Sheet 2).	Permitted for Reduced Inspection Interval.
Fuel injector guide cone for thermal barrier coating that is not there, (gone).	Any quantity of thermal barrier coating is permitted to not be there but can cause increased deterioration.	Permitted for Regular Inspection Interval.
Fuel injector end cap for radial cracks.	No cracks permitted.	Remove Engine in 5 Cycles Maximum or less.
Fuel injector end cap for material that is not there, (gone).	Material that is not there, (gone) is not permitted.	Remove Engine in 5 Cycles Maximum or less.

Combustion Chamber Area Borescope Inspection Damage Limits
Table 802 (Continued)

(11) After you complete the borescope inspection, install the AP−8 plugs as follows: See Figure 810.

(a) Use a nylon brush to clean the old antigalling compound from the threads of each AP plug.

(b) Apply a thin layer of new antigalling compound to the threads and to the plug head washer contact surface area, see Figure 810. See Table 801 for the necessary antigalling compound.

NOTE: Do not use Engine Oil P03−001 on the AP plug threads.

(c) If you apply more antigalling compound than is necessary to the plug, remove the unwanted compound with a rag or cloth.

(d) Put a new gasket or washer on each AP plug. See Table 801 for the necessary gasket or washer.

NOTE: Always use a new gasket or washer. Do not use an old gasket or washer.

(e) Install the AP plugs and gaskets or washers in the applicable borescope boss on the engine. See Table 801 for the necessary AP plug and gasket or washer part numbers for each location. Use a standard socket drive extension and ratchet to turn each AP plug into the boss. Hand tighten the plug only with the ratchet wrench.

(f) Use a standard torque wrench to torque the AP plugs. See Table 801 for the necessary torque specifications.

(g) Safety all the AP plugs with Lockwire P05−289.

Task 72-00-00-210-017:

1. Perform Borescope Inspection Of Stage 1 HPT Vanes (AP-8/AP-9)

A. Equipment And Materials Necessary

Standard Tools:
See Inspection/Check-01A for borescope equipment.

Special Tools:
PWA 86411 Guide Tube, AP-8 Port (for flexible borescope)

Consumable Materials:

Item No.	Designation
P06-023	Silver Goop (PWA 36001)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Washer	1	72-41-00/1/155
Lockwire	1	72-41-00/1/160

B. Procedure

(1) Remove plug and washer from borescope access port Number AP-9 (see Figure 801 and Figure 802) located on the rear of the diffuser case at the 3 o'clock location. See Table 801 Inspection/Check-01A for additional AP-9 borescope access port data.

(a) Make an inspection of the AP-9 plug. Measure the shaft diameter for wear. If the shaft diameter minimum dimension is less than 0.100 inch (2.540 mm), the AP-9 plug must be replaced.

(2) Refer to preceding paragraph and remove plugs and gaskets from AP-8 borescope access ports.

(a) Put PWA 86411 Guide Tube through the diffuser case access port at the AP-8 location with the tip pointed toward the front of the engine. Turn and position the tube such that the flexible borescope, when installed, will point rearwards towards the first stage nozzle guide vanes. Lock the guide tube in position by use of the compression nut.

CAUTION: TEMPERATURES IN AREAS TO BE BORESCOPED SHOULD BE PERMITTED TO COOL TO BELOW 150°F (65.6°C) FOLLOWING ENGINE OPERATION. DAMAGE MAY RESULT TO BORESCOPE EQUIPMENT IF EQUIPMENT IS EXPOSED TO GASPATH OR METAL TEMPERATURES IN EXCESS OF 150°F (65.6°C). AS A GUIDE - IF ADJACENT CASES ARE TOO HOT TO TOUCH COMFORTABLY, INSPECTION SHOULD BE DELAYED.

(3) Insert borescope through port and inspect Stage 1 HPT vanes for nicks, dents, base material breakthrough/burnthrough, cracks, burning, erosion, coating loss, blocked cooling air holes, sulfidation and damage caused by passage of foreign material.

NOTE: Maximum borescope insertion depth and borescope limiting access hole diameter specifications for AP-8 and AP-9 borescope ports are specified in Table 801 (Sheet 3) Inspection/Check-01A. R

(4) Borescope inspection limits for Stage 1 vanes.

CAUTION: FOLLOWING LIMITS ARE APPLICABLE ON A CONTINUE-IN-SERVICE BASIS ONLY. LIMIT IS BASED ON PART STRUCTURAL REQUIREMENTS AND DOES NOT IMPLY THAT ENGINE PERFORMANCE, STABILITY, OPERATING LIMITS, OR PART REPARABILITY WILL BE MAINTAINED.

(a) Limits for vane conditions observed during borescope inspection are given in Table 802 thru Table 806, and Figure 803 thru Figure 809. R R

(5) After borescope inspection, install AP-9 plug and new washer per requirements of Table 801.

(6) Refer to Inspection/Check-01D and install AP-8 plugs and gaskets per installation instructions.

AP Number And Location	Washer Required	Plug Locking Method	Plug Replacement Lubricant	Plug Torque lb-in. (N.m)
AP-9 Rear of Diffuser Case	Yes PN 580777	Lockwire (AS3214-02)	P06-023 Silver Goop	40 - 50 (4.519 - 5.649)

AP-9 Borescope Plug Installation Data
Table 801

Observed Condition: Nicks And Dents
See Figure 803.

Examine	Damage	Disposition
Leading edge, concave and convex airfoils, ID and OD platforms	Nicks and round bottomed dents (803/2) to 0.125 inch (3.175 mm) in length or diameter are permitted.	Permitted for regular inspection interval.
Trailing edge	Two nicks or dents (803/1) maximum on the trailing edge, separated by at least 0.750 inch (19.050 mm). Five vanes maximum on each engine.	Permitted for regular inspection interval.
	More than the above interval inspection limits.	Remove engine in 5 cycles maximum or less.

NOTE: If the view angle is such that the depth can be determined. The maximum nick and round bottom dent depth is 0.312 inch (7.925 mm).

Nicks And Dents Inspection
Table 802

R Observed Condition: Damaged Or Missing Thermal Barrier Coating
R See Figure 803.

	Examine	Damage	Disposition
R	Leading edge, concave and convex airfoils, ID and OD platforms, trailing edge	No limit on the quantity of chipped coating, coating loss, checking, crazed or cracked thermal barrier coating. See (803/3) and (803/4).	Permitted for regular inspection interval.

R NOTE: If a large quantity of thermal barrier coating is missing, (gone), and the vane is operated for a long time, it is possible that the vane cannot be repaired at overhaul. The vane base metal can become burned and eroded.

R Thermal Barrier Coating Inspection
R Table 803

Observed Condition: Burning and Erosion
See Figure 804.

Examine	Damage	Disposition
Leading edge, concave and convex airfoils, ID and OD platforms, trailing edge	No limit on the quantity of burning (804/1) and erosion (804/2) as long as it is not burned completely through the wall. See (804/1), (804/2), and (804/3).	Permitted for regular inspection interval.

Burning and Erosion Inspection
Table 804

Observed Condition: Material Breakthrough Or Burnthrough
See Figure 805.

Examine	Damage	Disposition
Leading edge, concave and convex airfoils, ID and OD platforms	One material breakthrough or burnthrough (805/2) with an open area (material that is not there) to 0.157 inch (3.988 mm) diameter or 0.019 sq-in. (12. sq-mm).	Permitted for regular inspection interval.
	One material breakthrough or burnthrough (805/1) and (805/4) with an open area (material that is not there) more than 0.157 inch (3.988 mm) but less than 0.300 inch (7.620 mm) diameter or to 0.070 sq-in. (45. sq-mm) maximum.	Permitted for 300 cycle reduced inspection interval.
	A maximum of five vanes for each engine with one material breakthrough or burnthrough (805/1), (805/4), and (805/6) more than 0.300 inch (7.620 mm) but less than 0.500 inch (12.700 mm) diameter or 0.196 sq-inch (126. sq-mm) into the internal cavity.	Permitted for 300 cycle reduced inspection interval.
	More than 5 vanes with one material breakthrough or burnthrough (805/1) and (805/6) more than 0.300 inch (7.620 mm) but less than 0.500 inch (12.700 mm) diameter or up 0.196 sq-inch (126. sq-mm) maximum.	Permitted for 150 cycle reduced inspection interval.
	For leading edge burnthrough more than	Permitted for 50 cycle reduced

Material Breakthrough Or Burnthrough Inspection
Table 805

R Observed Condition: Material Breakthrough Or Burnthrough
R See Figure 805.

R	Examine	Damage	Disposition
R		0.500 inch (12.700 mm) diameter: No limit on the number of vanes with leading edge burnthrough to 1.614 inch (40.996 mm) maximum radial length that does not go axially more than the first row of concave side cooling holes and does not go axially more than the second row of convex side cooling holes is permitted if there is no burning on the internal baffle.	inspection interval.
R		Vane baffle burned through.	Not permitted.
R		More than the above interval inspection limits.	Remove engine in 5 cycles maximum or less.
R	Concave side trailing edge	Burnthrough (805/3) less than 75% span of axial length from the trailing edge to the rear cooling holes and up 1.575 inches (40.005 mm) maximum width.	Permitted for regular inspection interval.
R		Burnthrough (805/5) more than 75% span of axial length from the trailing edge to the rear cooling holes and to 1.575 inches (40.005 mm) maximum width.	Permitted for 300 cycle reduced inspection interval.
R		Burnthrough (805/7) to 0.512 inch (13 mm) forward of the rear two rows of cooling holes and up to 1.575 inches (40.005 mm) maximum width.	Permitted for 150 cycle reduced inspection interval.

R Material Breakthrough Or Burnthrough Inspection
R Table 805 (Continued)

R Observed Condition: Material Breakthrough Or Burnthrough
R See Figure 805.

R	Examine	Damage	Disposition
	(CONTINUED)		
R		Burnthrough more than 0.511 inch (12.979 mm) forward of the rear two rows of cooling holes, or is more than 1.575 inches (40.005 mm) in width, or if the internal baffle is burned through.	Remove engine in 5 cycles maximum or less.
R	Convex side trailing edge	Burnthrough (805/8) less than 50% span from the trailing edge to the rear cooling holes.	Permitted for regular inspection interval.
R		Burnthrough (805/9) more than 50% span from the trailing edge to the rear cooling holes.	Permitted for 150 cycle reduced inspection interval.
R		Burnthrough is forward of the rear cooling holes.	Remove engine in 5 cycles maximum or less.

R Material Breakthrough Or Burnthrough Inspection
R Table 805 (Continued)

R Observed Condition: Cracks, (Axial And Radial)
R See Figure 806 thru Figure 809.

Examine	Damage	Disposition
Leading edge surface	No limit on the quantity of tight cracks (806/3). Closed loop cracks (806/4) are not permitted.	Permitted for regular inspection interval.
	One crack (806/5) in each vane starting at the ID or OD platform, to a maximum height of 0.500 inch (12.700 mm).	Permitted for regular inspection interval.
	A maximum of 3 cracks in each vane (806/1) which go to a concave or convex airfoil cooling hole. Closed loop cracks (806/4) are not permitted.	Permitted for regular inspection interval.
	Two cracks (806/2) in each vane starting at the ID or OD platforms, to a maximum height of 0.750 inch (19.050 mm).	Permitted for 300 cycle reduced inspection interval.
	More than the above interval inspection limits.	Remove engine in 5 cycles maximum or less.
Concave airfoil surface	No limit on the quantity of axial (807/1) or radial cracks (807/1A) less than 0.157 inch (3.988 mm) are permitted. Closed loop cracks (807/4) are not permitted.	Permitted for regular inspection interval.
	A maximum of three axial cracks (807/2) that go from one cooling hole	Permitted for regular inspection interval.

R NOTE: A crack or part length of a crack that has burned or eroded to a width more than 0.050 inch (1.270 mm) must be identified as a hole. The breakthrough or burnthrough limits apply.

R Crack Inspection
R Table 806

R Observed Condition: Cracks, (Axial And Radial)
R See Figure 806 thru Figure 809.

Examine	Damage	Disposition
(CONTINUED)	group to the next cooling hole group or from the trailing edge to the rear cooling hole group are permitted. One of the above three axial cracks can go forward or rearward to the next cooling hole group or from the trailing edge through the rear cooling hole group to the next cooling hole group.	
	No limit on the quantity of axial cracks (807/6) that go from one cooling hole group to the next cooling hole group or from the trailing edge to the rear cooling hole group if the cracks do not form a closed loop.	Permitted for 300 cycle reduced inspection interval.
	Radial cracks (807/3) that go from the ID or OD platform to the concave airfoil are permitted. The maximum crack length on the airfoil from the platform is 0.500 inch (12.700 mm). Cracks from a platform that go to the airfoil surface cannot intersect other cracks on the airfoil surface.	Permitted for regular inspection interval.

R Crack Inspection
R Table 806 (Continued)

R Observed Condition: Cracks, (Axial And Radial)
R See Figure 806 thru Figure 809.

Examine	Damage	Disposition
	Radial cracks (807/8) that go from the ID or OD platform to the concave airfoil surface more than 0.500 inch (12.700 mm) but less than 0.800 inch (20.320 mm). Cracks from a platform that go to the airfoil surface cannot intersect other cracks on the airfoil surface.	Permitted for 300 cycle reduced inspection interval.
	Three radial cracks (807/1A) maximum to 0.500 inch (12.700 mm) maximum length are permitted.	Permitted for regular inspection interval.
	No limit on the quantity of radial cracks (807/6A) to 0.800 inch (20.320 mm) length.	Permitted for 300 cycle reduced inspection interval.
	A crack (807/5) can intersect with another crack, except for cracks that start at the ID or OD platform. The maximum length for either crack leg is 0.400 inch (10.160 mm). The intersection of platform cracks with airfoil cracks is not permitted.	Permitted for regular inspection interval.
	An intersecting crack (807/7) with a leg more than 0.400 inch (10.160 mm) and less than 0.800 inch (20.320 mm) except for cracks that start at the ID or OD platform. The intersection of	Permitted for 300 cycle reduced inspection interval.

R Crack Inspection
R Table 806 (Continued)

Observed Condition: Cracks, (Axial And Radial)
See Figure 806 thru Figure 809.

Examine	Damage	Disposition
	platform cracks with airfoil cracks is not permitted.	
	More than the above interval inspection limits.	Remove engine in 5 cycles maximum or less.
Convex airfoil surface	No limit on the quantity of axial (808/1) or radial cracks (808/1A) less than 0.157 inch (3.988 mm) are permitted. Closed loop cracks (808/5) are not permitted.	Permitted for regular inspection interval.

NOTE: A crack or part length of a crack that has burned or eroded to a width more than 0.050 inch (1.270 mm) must be identified as a hole. The breakthrough or burnthrough limits apply.

Examine	Damage	Disposition
	Three axial cracks maximum to 0.500 inch (12.700 mm) maximum length except as follows: One of the three axial cracks (808/3) can traverse from the trailing edge for a maximum distance of 0.750 inch (19.050 mm).	Permitted for regular inspection interval.
	Six axial cracks (808/6) maximum to 0.800 inch (20.320 mm) maximum length except as follows: One of the six axial cracks (808/8) can traverse from the trailing edge for a maximum distance of 1.300 inches (33.020 mm), or to the last row of cooling holes.	Permitted for 300 cycle reduced inspection interval.

Crack Inspection
Table 806 (Continued)

Observed Condition: Cracks, (Axial And Radial)
See Figure 806 thru Figure 809.

Examine	Damage	Disposition
(CONTINUED)		
	One axial crack (808/3) from the trailing edge to a maximum of 1.181 inches (29.997 mm).	Permitted for regular inspection interval.
	One axial crack (808/8) from the trailing edge more than 1.181 inches (29.997 mm) to 2.362 inches (59.995 mm) maximum is permitted.	Permitted for 300 cycle reduced inspection interval.
	Three radial cracks (808/1A) to 0.500 inch (12.700 mm) maximum length.	Permitted for regular inspection interval.
	No limit on the quantity of radial cracks (808/6A) to 0.800 inch (20.320 mm) maximum.	Permitted for 300 cycle reduced inspection interval.
	A crack can intersect with another crack (808/4) except for cracks that start at the ID or OD platforms. The maximum length for either crack leg is 0.500 inch (12.700 mm). Intersection of platform cracks with airfoil cracks is not permitted.	Permitted for regular inspection interval.
	An intersecting crack (808/9) with a leg more than 0.500 inch (12.700 mm) and less than 0.800 inch (20.320 mm) except for cracks that start at the ID or OD platform. Intersection of platform	Permitted for 300 cycle reduced inspection interval.

Crack Inspection
Table 806 (Continued)

Observed Condition: Cracks, (Axial And Radial)
See Figure 806 thru Figure 809.

Examine	Damage	Disposition
(CONTINUED)		
	cracks with airfoil cracks is not permitted.	
	Radial cracks (808/2) that go from the ID or OD platforms to the convex airfoil are permitted. The maximum crack length on the airfoil from the platform is 0.500 inch (12.700 mm). Cracks from a platform (808/2) that go to the airfoil surface cannot intersect other cracks on the airfoil surface.	Permitted for regular inspection interval.
	Radial cracks (808/7) that go from the ID or OD platform to the convex airfoil surface more than 0.500 inch (12.700 mm) but less than 0.800 inch (20.320 mm) are permitted. Cracks from a platform that go to the airfoil surface cannot intersect other cracks on the airfoil surface.	Permitted for 300 cycle reduced inspection interval.
	More than the above interval inspection limits.	Remove engine in 5 cycles maximum or less.
ID and OD platform surfaces (buttresses)	No limit on the quantity of cracks less than 0.250 inch (6.350 mm) in length on the platform surfaces are permitted. Intersecting cracks are permitted if no closed loop is formed.	Permitted for regular inspection interval.

Crack Inspection
Table 806 (Continued)

R Observed Condition: Cracks, (Axial And Radial)
R See Figure 806 thru Figure 809.

	Examine	Damage	Disposition
	(CONTINUED)		
R		Closed loop cracks are not permitted. See Figure 809 (Sheet 1).	

R NOTE: A crack or part length of a crack that has burned or eroded to a width of more than 0.050 inch (1.270 mm) must be identified as a hole. The breakthrough or burnthrough limits apply.

	Examine	Damage	Disposition
R		Four cracks (809/4) more than 0.250 inch (6.350 mm) long, three cracks more than 0.700 inch (17.780 mm), and one crack to (no length limit) are permitted on the OD platform concave airfoil side. These cracks can go to the airfoil concave surface to a height of 0.500 inch (12.70 mm).	Permitted for regular inspection interval.
R		Six cracks (809/9) more than 0.250 inch (6.350 mm) long, four cracks more than 0.700 inch (17.780 mm), and two cracks to (no length limit) are permitted on the OD platform concave airfoil side. These cracks can go to the airfoil concave surface to a height of 0.800 inch (20.320 mm).	Permitted for 300 cycle reduced inspection interval.
R		Two cracks (809/4A) more than 0.250 inch (6.350 mm) long are permitted on the OD platform convex airfoil side, from the airfoil fillet to platform edge.	Permitted for regular inspection interval.

R Crack Inspection
R Table 806 (Continued)

R Observed Condition: Cracks, (Axial And Radial)
R See Figure 806 thru Figure 809.

Examine	Damage	Disposition
(CONTINUED)		
	Four cracks (809/9A) more than 0.250 inch (6.350 mm) long are permitted on the OD platform convex airfoil side, from the airfoil fillet to platform edge.	Permitted for 300 cycle reduced inspection interval.
	Two cracks (809/4B) more than 0.250 inch (6.350 mm) long are permitted on the ID platform, concave or convex airfoil side, from the airfoil fillet to platform edge.	Permitted for regular inspection interval.
	Four cracks (809/9B) more than 0.250 inch (6.350 mm) long are permitted on the ID platform, concave or convex airfoil side, from the airfoil fillet to platform edge.	Permitted for 300 cycle reduced inspection interval.
	One crack (809/1) maximum for each side and two cracks total for each vane in the ID or OD fillet radius that goes parallel or axially along the fillet radius surface. The maximum length is 0.600 inch (15.240 mm). Airfoil/platform fillet radius cracks can intersect other cracks, if the total length is less than 1.0 inch (25.400 mm). No circumferential cracks in the leading edge fillet.	Permitted for regular inspection interval.
	One crack (809/6) maximum	Permitted for 300

Platform (Buttress) Cracks (AP−8 Or AP−9 Viewing)
R Figure 809 (Sheet 2)
(Task 72−00−00−210−017)

Task 72-00-00-210-028:

1. Perform Borescope Inspection Of Stage 1 HPT Vanes (AP-8)

A. Equipment And Materials Necessary

Standard Tools:
See Inspection/Check-01A (Task 72-00-00-990-011) for borescope equipment.

Consumable Materials:

Item No.	Designation
P05-289	Lockwire
P06-023	Thread Lubricant (PWA 36001 or PMC 9940)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	6	72-41-00/1/130A

B. Procedure

(1) Remove the AP-8 access port plugs from the diffuser case as follows: See Figure 801.

NOTE: Table 801 shows more specifications for the plugs at location AP-8.

(a) Cut the safety wire and remove the safety wire from the plugs that will be removed.

(b) Use a standard 3/8 socket drive extension and a breaker bar or ratchet to remove the AP-8 plugs.

(c) Remove the AP-8 plugs and gaskets, as necessary, for the examination of the stage 1 HPT vanes.

(d) Discard all the old gaskets.

Access Port & (Stage)	Angular Location Clockwise From Rear	Gasket P/N	Plug P/N	Plug Thread Lubricant	Plug Torque lb-in. (N.m)
AP-8	45° (1:30 o'clock)	512640	50A725	P06-023	40 - 50 (4.519 - 5.649)

Borescope Access Port (AP) Data
Table 801

Access Port & (Stage)	Angular Location Clockwise From Rear	Gasket P/N	Plug P/N	Plug Thread Lubricant	Plug Torque lb-in. (N.m)
AP-8	127° (4:30 o'clock)	512640	50A725	P06-023	40 - 50 (4.519 - 5.649)
AP-8	172° (6:00 o'clock)	512640	50A725	P06-023	40 - 50 (4.519 - 5.649)
AP-8	225° (7:30 o'clock)	512640	50A725	P06-023	40 - 50 (4.519 - 5.649)
AP-8	277° (9:00 o'clock)	512640	50A725	P06-023	40 - 50 (4.519 - 5.649)
AP-8	338° (11:00 o'clock)	512640	50A725	P06-023	40 - 50 (4.519 - 5.649)

For Engines Equipped:

NOTE: If the high stage temp sensor was removed to borescope through the (338°C) 11:00 o'clock port, reinstall per Section 71-00-41, Installation-04.

Borescope Access Port (AP) Data
Table 801 (Continued)

CAUTION: TEMPERATURES IN AREAS TO BE BORESCOPED SHOULD BE PERMITTED TO COOL TO BELOW 150°F (65.6°C) FOLLOWING ENGINE OPERATION. DAMAGE MAY RESULT TO BORESCOPE EQUIPMENT IF EQUIPMENT IS EXPOSED TO GASPATH OR METAL TEMPERATURES IN EXCESS OF 150°F (65.6°C). AS A GUIDE - IF ADJACENT CASES ARE TOO HOT TO TOUCH COMFORTABLY, INSPECTION SHOULD BE DELAYED.

(2) Insert the flexible borescope through the port and inspect the Stage 1 HPT vanes for nicks, dents, base material breakthrough/burnthrough, cracks, burning, erosion, coating loss, blocked cooling air holes,

sulfidation and damage caused by passage of foreign material.

NOTE: Maximum borescope insertion depth and borescope limiting access hole diameter specifications for AP−8 borescope ports are given in Table 801 Inspection/Check−01A Task 72−00−00−990−011.

(3) Borescope inspection limits for Stage 1 vanes.

CAUTION: FOLLOWING LIMITS ARE APPLICABLE ON A CONTINUE−IN−SERVICE BASIS ONLY. LIMIT IS BASED ON PART STRUCTURAL REQUIREMENTS AND DOES NOT IMPLY THAT ENGINE PERFORMANCE, STABILITY, OPERATING LIMITS, OR PART REPARABILITY WILL BE MAINTAINED.

(a) Limits for vane conditions observed during
R borescope inspection are given in Table 802 thru
R Table 806 and Figure 803 thru Figure 809.

(4) After you complete the borescope inspection, install the AP−8 plugs as follows:

(a) Use a nylon brush to clean the old antigalling compound from the threads of each AP plug.

(b) Apply a thin layer of new antigalling compound to the threads and to the plug head washer contact surface area. See Table 801 for the necessary antigalling compound.

NOTE: Do not use Engine Oil P03−001 on the AP plug threads.

(c) If you apply more antigalling compound than is necessary to the plug, remove the unwanted compound with a rag or cloth.

(d) Put a new gasket or washer on each AP plug, as necessary. See Table 801 for the necessary gasket or washer.

NOTE: Always use a new gasket or washer. Do not use an old gasket or washer.

(e) Install the AP plugs and gaskets or washers in the applicable borescope boss on the engine. See Table 801 for the necessary AP plug and gasket or washer part numbers for each location. Use a standard socket drive extension and ratchet to turn each AP plug into the boss. Hand tighten the plug only with the ratchet wrench.

(f) Use a standard torque wrench to torque the AP plugs. See Table 801 for the necessary torque specifications.

(g) Safety all the AP plugs with Lockwire P05-289.

Observed Condition: Nicks And Dents
See Figure 803.

Examine	Damage	Disposition
Leading edge, concave and convex airfoils, ID and OD platforms	Nicks and round bottomed dents (803/2) to 0.125 inch (3.175 mm) in length or diameter are permitted.	Permitted for regular inspection interval.

NOTE: If the view angle is such that the depth can be determined. The maximum nick and round bottom dent depth is 0.312 inch (7.925 mm).

Examine	Damage	Disposition
Trailing edge	Two nicks or dents (803/1) maximum on the trailing edge, separated by at least 0.750 inch (19.050 mm). Five vanes maximum on each engine.	Permitted for regular inspection interval.
	More than the above interval inspection limits.	Remove engine in 5 cycles maximum or less.

Nicks And Dents Inspection
Table 802

Observed Condition: Damaged Or Missing Thermal Barrier Coating
See Figure 803.

Examine	Damage	Disposition
Leading edge, concave and convex airfoils, ID and OD platforms, trailing edge	No limit on the quantity of chipped coating, coating loss, checking, crazed or cracked thermal barrier coating. See (803/3) and (803/4).	Permitted for regular inspection interval.

NOTE: If a large quantity of thermal barrier coating is missing, (gone), and the vane is operated for a long time, it is possible that the vane cannot be repaired at overhaul. The vane base metal can become burned and eroded.

Thermal Barrier Coating Inspection
Table 803

Observed Condition: Burning and Erosion
See Figure 804.

Examine	Damage	Disposition
Leading edge, concave and convex airfoils, ID and OD platforms, trailing edge	No limit on the quantity of burning (804/1) and erosion (804/2) as long as it is not burned completely through the wall. See (804/1), (804/2), and (804/3).	Permitted for regular inspection interval.

Burning and Erosion Inspection
Table 804

Observed Condition: Material Breakthrough Or Burnthrough
See Figure 805.

Examine	Damage	Disposition
Leading edge, concave and convex airfoils, ID and OD platforms	One material breakthrough or burnthrough (805/2) with an open area (material that is not there) to 0.157 inch (3.988 mm) diameter or 0.019 sq-in. (12. sq-mm).	Permitted for regular inspection interval.
	One material breakthrough or burnthrough (805/1) and (805/4) with an open area (material that is not there) more than 0.157 inch (3.988 mm) but less than 0.300 inch (7.620 mm) diameter or to 0.070 sq-in. (45. sq-mm) maximum.	Permitted for 300 cycle reduced inspection interval.
	A maximum of five vanes for each engine with one material breakthrough or burnthrough (805/1), (805/4), and (805/6) more than 0.300 inch (7.620 mm) but less than 0.500 inch (12.700 mm) diameter or 0.196 sq-inch (126. sq-mm) into the internal cavity.	Permitted for 300 cycle reduced inspection interval.
	More than 5 vanes with one material breakthrough or burnthrough (805/1) and (805/6) more than 0.300 inch (7.620 mm) but less than 0.500 inch (12.700 mm) diameter or up 0.196 sq-inch (126. sq-mm) maximum.	Permitted for 150 cycle reduced inspection interval.
	For leading edge burnthrough more than	Permitted for 50 cycle reduced

Material Breakthrough Or Burnthrough Inspection
Table 805

Observed Condition: Material Breakthrough Or Burnthrough
See Figure 805.

Examine	Damage	Disposition
	0.500 inch (12.700 mm) diameter: No limit on the number of vanes with leading edge burnthrough to 1.614 inch (40.996 mm) maximum radial length that does not go axially more than the first row of concave side cooling holes and does not go axially more than the second row of convex side cooling holes is permitted if there is no burning on the internal baffle.	inspection interval.
	Vane baffle burned through.	Not permitted.
	More than the above interval inspection limits.	Remove engine in 5 cycles maximum or less.
Concave side trailing edge	Burnthrough (805/3) less than 75% span of axial length from the trailing edge to the rear cooling holes and up 1.575 inches (40.005 mm) maximum width.	Permitted for regular inspection interval.
	Burnthrough (805/5) more than 75% span of axial length from the trailing edge to the rear cooling holes and to 1.575 inches (40.005 mm) maximum width.	Permitted for 300 cycle reduced inspection interval.
	Burnthrough (805/7) to 0.512 inch (13 mm) forward of the rear two rows of cooling holes and up to 1.575 inches (40.005 mm) maximum width.	Permitted for 150 cycle reduced inspection interval.

Material Breakthrough Or Burnthrough Inspection
Table 805 (Continued)

R Observed Condition: Material Breakthrough Or Burnthrough
R See Figure 805.

R	Examine	Damage	Disposition
	(CONTINUED)		
R		Burnthrough more than 0.511 inch (12.979 mm) forward of the rear two rows of cooling holes, or is more than 1.575 inches (40.005 mm) in width, or if the internal baffle is burned through.	Remove engine in 5 cycles maximum or less.
R	Convex side trailing edge	Burnthrough (805/8) less than 50% span from the trailing edge to the rear cooling holes.	Permitted for regular inspection interval.
R		Burnthrough (805/9) more than 50% span from the trailing edge to the rear cooling holes.	Permitted for 150 cycle reduced inspection interval.
R		Burnthrough is forward of the rear cooling holes.	Remove engine in 5 cycles maximum or less.

R Material Breakthrough Or Burnthrough Inspection
R Table 805 (Continued)

Observed Condition: Cracks, (Axial And Radial)
See Figure 806 thru Figure 809.

Examine	Damage	Disposition
Leading edge surface	No limit on the quantity of tight cracks (806/3). Closed loop cracks (806/4) are not permitted.	Permitted for regular inspection interval.
	One crack (806/5) in each vane starting at the ID or OD platform, to a maximum height of 0.500 inch (12.700 mm).	Permitted for regular inspection interval.
	A maximum of 3 cracks in each vane (806/1) which go to a concave or convex airfoil cooling hole. Closed loop cracks (806/4) are not permitted.	Permitted for regular inspection interval.
	Two cracks (806/2) in each vane starting at the ID or OD platforms, to a maximum height of 0.750 inch (19.050 mm).	Permitted for 300 cycle reduced inspection interval.
	More than the above interval inspection limits.	Remove engine in 5 cycles maximum or less.
Concave airfoil surface	No limit on the quantity of axial (807/1) or radial cracks (807/1A) less than 0.157 inch (3.988 mm) are permitted. Closed loop cracks (807/4) are not permitted.	Permitted for regular inspection interval.

NOTE: A crack or part length of a crack that has burned or eroded to a width more than 0.050 inch (1.270 mm) must be identified as a hole. The breakthrough or burnthrough limits apply.

	A maximum of three axial cracks (807/2) that go from one cooling hole	Permitted for regular inspection interval.

Crack Inspection
Table 806

R Observed Condition: Cracks, (Axial And Radial)
R See Figure 806 thru Figure 809.

(CONTINUED)

Examine	Damage	Disposition
	group to the next cooling hole group or from the trailing edge to the rear cooling hole group are permitted. One of the above three axial cracks can go forward or rearward to the next cooling hole group or from the trailing edge through the rear cooling hole group to the next cooling hole group.	
	No limit on the quantity of axial cracks (807/6) that go from one cooling hole group to the next cooling hole group or from the trailing edge to the rear cooling hole group if the cracks do not form a closed loop.	Permitted for 300 cycle reduced inspection interval.
	Radial cracks (807/3) that go from the ID or OD platform to the concave airfoil are permitted. The maximum crack length on the airfoil from the platform is 0.500 inch (12.700 mm). Cracks from a platform that go to the airfoil surface cannot intersect other cracks on the airfoil surface.	Permitted for regular inspection interval.

R Crack Inspection
R Table 806 (Continued)

Observed Condition: Cracks, (Axial And Radial)
See Figure 806 thru Figure 809.

Examine	Damage	Disposition
	Radial cracks (807/8) that go from the ID or OD platform to the concave airfoil surface more than 0.500 inch (12.700 mm) but less than 0.800 inch (20.320 mm). Cracks from a platform that go to the airfoil surface cannot intersect other cracks on the airfoil surface.	Permitted for 300 cycle reduced inspection interval.
	Three radial cracks (807/1A) maximum to 0.500 inch (12.700 mm) maximum length are permitted.	Permitted for regular inspection interval.
	No limit on the quantity of radial cracks (807/6A) to 0.800 inch (20.320 mm) length.	Permitted for 300 cycle reduced inspection interval.
	A crack (807/5) can intersect with another crack, except for cracks that start at the ID or OD platform. The maximum length for either crack leg is 0.400 inch (10.160 mm). The intersection of platform cracks with airfoil cracks is not permitted.	Permitted for regular inspection interval.
	An intersecting crack (807/7) with a leg more than 0.400 inch (10.160 mm) and less than 0.800 inch (20.320 mm) except for cracks that start at the ID or OD platform. The intersection of	Permitted for 300 cycle reduced inspection interval.

Crack Inspection
Table 806 (Continued)

Observed Condition: Cracks, (Axial And Radial)
See Figure 806 thru Figure 809.

Examine	Damage	Disposition
	platform cracks with airfoil cracks is not permitted.	
	More than the above interval inspection limits.	Remove engine in 5 cycles maximum or less.
Convex airfoil surface	No limit on the quantity of axial (808/1) or radial cracks (808/1A) less than 0.157 inch (3.988 mm) are permitted. Closed loop cracks (808/5) are not permitted.	Permitted for regular inspection interval.

NOTE: A crack or part length of a crack that has burned or eroded to a width more than 0.050 inch (1.270 mm) must be identified as a hole. The breakthrough or burnthrough limits apply.

Examine	Damage	Disposition
	Three axial cracks maximum to 0.500 inch (12.700 mm) maximum length except as follows: One of the three axial cracks (808/3) can traverse from the trailing edge for a maximum distance of 0.750 inch (19.050 mm).	Permitted for regular inspection interval.
	Six axial cracks (808/6) maximum to 0.800 inch (20.320 mm) maximum length except as follows: One of the six axial cracks (808/8) can traverse from the trailing edge for a maximum distance of 1.300 inches (33.020 mm), or to the last row of cooling holes.	Permitted for 300 cycle reduced inspection interval.

Crack Inspection
Table 806 (Continued)

Observed Condition: Cracks, (Axial And Radial)
See Figure 806 thru Figure 809.

Examine	Damage	Disposition
(CONTINUED)		
	One axial crack (808/3) from the trailing edge to a maximum of 1.181 inches (29.997 mm).	Permitted for regular inspection interval.
	One axial crack (808/8) from the trailing edge more than 1.181 inches (29.997 mm) to 2.362 inches (59.995 mm) maximum is permitted.	Permitted for 300 cycle reduced inspection interval.
	Three radial cracks (808/1A) to 0.500 inch (12.700 mm) maximum length.	Permitted for regular inspection interval.
	No limit on the quantity of radial cracks (808/6A) to 0.800 inch (20.320 mm) maximum.	Permitted for 300 cycle reduced inspection interval.
	A crack can intersect with another crack (808/4) except for cracks that start at the ID or OD platforms. The maximum length for either crack leg is 0.500 inch (12.700 mm). Intersection of platform cracks with airfoil cracks is not permitted.	Permitted for regular inspection interval.
	An intersecting crack (808/9) with a leg more than 0.500 inch (12.700 mm) and less than 0.800 inch (20.320 mm) except for cracks that start at the ID or OD platform. Intersection of platform	Permitted for 300 cycle reduced inspection interval.

Crack Inspection
Table 806 (Continued)

Observed Condition: Cracks, (Axial And Radial)
See Figure 806 thru Figure 809.

Examine	Damage	Disposition
(CONTINUED)		
	cracks with airfoil cracks is not permitted.	
	Radial cracks (808/2) that go from the ID or OD platforms to the convex airfoil are permitted. The maximum crack length on the airfoil from the platform is 0.500 inch (12.700 mm). Cracks from a platform (808/2) that go to the airfoil surface cannot intersect other cracks on the airfoil surface.	Permitted for regular inspection interval.
	Radial cracks (808/7) that go from the ID or OD platform to the convex airfoil surface more than 0.500 inch (12.700 mm) but less than 0.800 inch (20.320 mm) are permitted. Cracks from a platform that go to the airfoil surface cannot intersect other cracks on the airfoil surface.	Permitted for 300 cycle reduced inspection interval.
	More than the above interval inspection limits.	Remove engine in 5 cycles maximum or less.
ID and OD platform surfaces (buttresses)	No limit on the quantity of cracks less than 0.250 inch (6.350 mm) in length on the platform surfaces are permitted. Intersecting cracks are permitted if no closed loop is formed.	Permitted for regular inspection interval.

Crack Inspection
Table 806 (Continued)

Observed Condition: Cracks, (Axial And Radial)
See Figure 806 thru Figure 809.

Examine	Damage	Disposition
(CONTINUED)	Closed loop cracks are not permitted. See Figure 809 (Sheet 1).	

NOTE: A crack or part length of a crack that has burned or eroded to a width of more than 0.050 inch (1.270 mm) must be identified as a hole. The breakthrough or burnthrough limits apply.

Examine	Damage	Disposition
	Four cracks (809/4) more than 0.250 inch (6.350 mm) long, three cracks more than 0.700 inch (17.780 mm), and one crack to (no length limit) are permitted on the OD platform concave airfoil side. These cracks can go to the airfoil concave surface to a height of 0.500 inch (12.70 mm).	Permitted for regular inspection interval.
	Six cracks (809/9) more than 0.250 inch (6.350 mm) long, four cracks more than 0.700 inch (17.780 mm), and two cracks to (no length limit) are permitted on the OD platform concave airfoil side. These cracks can go to the airfoil concave surface to a height of 0.800 inch (20.320 mm).	Permitted for 300 cycle reduced inspection interval.
	Two cracks (809/4A) more than 0.250 inch (6.350 mm) long are permitted on the OD platform convex airfoil side, from the airfoil fillet to platform edge.	Permitted for regular inspection interval.

Crack Inspection
Table 806 (Continued)

Observed Condition: Cracks, (Axial And Radial)
See Figure 806 thru Figure 809.

Examine	Damage	Disposition
(CONTINUED)		
	Four cracks (809/9A) more than 0.250 inch (6.350 mm) long are permitted on the OD platform convex airfoil side, from the airfoil fillet to platform edge.	Permitted for 300 cycle reduced inspection interval.
	Two cracks (809/4B) more than 0.250 inch (6.350 mm) long are permitted on the ID platform, concave or convex airfoil side, from the airfoil fillet to platform edge.	Permitted for regular inspection interval.
	Four cracks (809/9B) more than 0.250 inch (6.350 mm) long are permitted on the ID platform, concave or convex airfoil side, from the airfoil fillet to platform edge.	Permitted for 300 cycle reduced inspection interval.
	One crack (809/1) maximum for each side and two cracks total for each vane in the ID or OD fillet radius that goes parallel or axially along the fillet radius surface. The maximum length is 0.600 inch (15.240 mm). Airfoil/platform fillet radius cracks can intersect other cracks, if the total length is less than 1.0 inch (25.400 mm). No circumferential cracks in the leading edge fillet.	Permitted for regular inspection interval.
	One crack (809/6) maximum	Permitted for 300

Crack Inspection
Table 806 (Continued)

Observed Condition: Cracks, (Axial And Radial)
See Figure 806 thru Figure 809.

Examine	Damage	Disposition
(CONTINUED)		
	for each side and two cracks total for each vane in the ID or OD fillet radius that goes parallel or axially along the fillet radius surface. The maximum length is 1.000 inch (25.400 mm). Airfoil/platform fillet radius cracks can intersect other cracks, if the total length is less than 1.750 inches (44.450 mm). One crack maximum in the ID or OD leading edge fillet radius surface (809/8) that goes circumferentially around the leading edge to a length of 0.400 inch (10.160 mm) maximum.	cycle reduced inspection interval.
	More than the above interval inspection limits.	Remove engine in 5 cycles maximum or less.

ENGINE GENERAL − INSPECTION/CHECK−01F

Task 72−00−00−210−005:

1. Perform Borescope Inspection Of Stage 1 HPT Blades And Duct Segments (AP−8/AP−9/ AP−11)

A. Equipment And Materials Necessary

Standard Tools:

See 72−00−00 Inspection/Check−01A (Task 72−00−00−990−010) for borescope equipment.

Special Tools:

PWA 86411	Guide Tube, AP−8 Port (use with flexible scope)

Consumable Materials:

Item No.	Designation
P03−001	Engine Oil (PWA 521B)
P06−023	Silver Goop (PWA 36001)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Washer AP−9	1	72−00−51/4/1
Safety Cable or Lockwire AP−9	1	72−00−51/4/11
Ferrule, Safety Cable AP−9	1	72−00−51/4/12
Gasket AP−11	1	75−24−00/3/55

B. Procedure
See Figure 801, Figure 802, Figure 803, Figure 804 and Figure 805.

(1) Remove plug and washer from borescope access port number AP−9, located on the rear of the diffuser case at the 3 o'clock location. See Table 801 of 72−00−00 Inspection/Check−01A, General Borescope Inspection Procedures And Borescope Access Port (AP) Data, Task 72−00−00−990−010.

(a) Make an inspection of the AP−9 plug. Measure the shaft diameter for wear. If the shaft diameter minimum dimension is less than 0.100 inch (2.540 mm), the AP−9 plug must be replaced.

(2) For engines equipped, remove three bolts, plug and gasket from borescope access port AP−11 located on the lower turbine cooling air tube elbow at the 7 o'clock position.

(3) To inspect stage 1 blades through AP−8 port, refer to 72−00−00 Inspection/Check−01D Task 72−00−00−210−020 and remove plugs and gaskets from the AP−8 access port(s).

(a) Put PWA 86411 Guide Tube through the diffuser case access port at the AP−8 location with the tip pointed toward the front of the engine. Turn and position the tube such that the flexible borescope when installed, will point rearwards towards the 1st stage nozzle guide vanes. Lock the guide tube in position by use of the compression nut.

CAUTION: TEMPERATURES IN AREAS TO BE BORESCOPED SHOULD BE PERMITTED TO COOL TO BELOW 150°F (65.6°C) FOLLOWING ENGINE OPERATION. DAMAGE MAY RESULT TO BORESCOPE EQUIPMENT IF EQUIPMENT IS EXPOSED TO GASPATH OR METAL TEMPERATURES IN EXCESS OF 150°F (65.6°C). AS A GUIDE − IF ADJACENT CASES ARE TOO HOT TO TOUCH COMFORTABLY, INSPECTION SHOULD BE DELAYED.

(4) Insert borescope through port and inspect Stage 1 blades for nicks, dents, cracks, tip damage, erosion, coating loss, liberated material, bent tips, tip rub, airfoil growth, blocked cooling holes, airfoil bulging and burning, sulfidation and damage caused by passage of foreign material. See Figure 803. To view each blade, rotate high rotor using hand or power operated equipment. See 72−00−00 Inspection/Check−01A, Installation Of The Rotator Used To Turn The N2 Rotor, Task 72−00−00−480−001.

NOTE: Conditions noted above are per blade and unless otherwise stated all blades may exhibit conditions described within limits provided.

NOTE: Maximum borescope insertion depth and borescope limiting access hole diameter specifications for AP−9, AP−11 and AP−8 are provided in Table 801 of 72−00−00 Inspection/Check−01A, General Borescope Inspection Procedures And Borescope Access Port (AP) Data, Task 72−00−00−990−010.

(5) Borescope inspection limits for Stage 1 HPT blades.

NOTE: Additional borescope recommendations for certain part number (configuration) high pressure turbine 1st stage blades are contained in SB PW4ENG 72−422. The information in SB PW4ENG 72−422 must be combined with the information that follows to form a complete inspection program for high pressure turbine 1st stage blades (applicable only to engines with 1st stage blades addressed by SB PW4ENG 72−422).

CAUTION: FOLLOWING LIMITS ARE APPLICABLE ON A CONTINUE−IN−SERVICE BASIS ONLY. LIMIT IS BASED ON PART STRUCTURAL REQUIREMENTS AND DOES NOT IMPLY THAT ENGINE PERFORMANCE, STABILITY, OPERATING LIMITS, OR PART REPARABILITY WILL BE MAINTAINED.

(a) Limits for blade conditions observed during borescope inspection are given in Figure 802 through Figure 805.

NOTE: Additional borescope recommendations for certain part number (configuration) high pressure turbine 1st stage blades are contained in SB PW4ENG 72−422. The information in SB PW4ENG 72−422 must be combined with the information that follows to form a complete inspection program for high pressure turbine 1st stage blades (applicable only to engines with 1st stage blades addressed by SB PW4ENG 72−422).

(b) Blade cracking. The limits for blade cracking observed during borescope inspection are given in Figure 802 through Figure 805.

CAUTION: LOSS OF BLADE COATING MAY RESULT IN DEGRADATION OF THE BASE ALLOY. THIS CONDITION, AS WELL AS HOT CORROSION ATTACK (SULFIDATION), CAN AFFECT BLADE REPARABILITY.

(c) Airfoil bulging.

1 Inspect for concave side bulging. Using a flexible borescope through AP−11 it is possible to detect a bulge by keeping the borescope parallel and very close to the concave airfoil surface. Small bulges may be detectable by a shadow seen beyond the bulge. See Figure 804. Using a flexible borescope through AP−8 with a guide tube it may also be possible to detect larger bulges.

2 For engines not equipped with AP−11, or as an alternate method, inspect for concave side airfoil dark spots using a flexible borescope with a guide tube through AP−8. First stage HPT blades which have bulged airfoils typically exhibit a large dark spot in the region of the bulge. Dark spots extending forward of the fifth tip cooling hole are indicative of hot operating conditions, for the blade, which may result in bulging. See Figure 805 for dark spot and fifth tip cooling hole identification.

(d) Blade erosion/corrosion.

NOTE: First indication of corrosion is circular shaped stains or markings on blade outer surfaces. Characteristic of sulfidation corrosive attack is a greenish to pale blue color. See the Standard Practices Manual, Section 70.

(6) Examine the HPT 1st stage duct segments for spalling (ceramic coating which is not there).

(a) All quantities of spalling are permitted.

(b) Ceramic spalling causes the conditions that follow:

1 Increased tip clearance of the HPT 1st stage blade.

2 Increased EGT.

3 Increased fuel consumption.

4 Possible damage to the tip of the HPT 1st stage blades.

5 Possible damage to the HPT 2nd stage blades.

(7) If the HPT 1st stage duct segments are spalled, do the inspection of the HPT 1st and 2nd stage blades for damage.

(8) After borescope inspection, install AP-9 plug and new washer and, for engines equipped, install AP-11 plug, new gasket and three bolts per requirements of Table 801.

AP Number And Location	Washer Required	Plug Locking Method	Plug Replacement Lubricant	Plug Torque lb-in. (N.m)
AP-9 Rear of Diffuser Case	Yes PN 584977 (Washer)	Lockwire (AS3214-02)	P06-023 Silver Goop	40 - 50 (4.519 - 5.649)
AP-11 Lower TCA Tube	Yes PN ST 1142-011 (Gasket)	Self Locking	P03-001 Engine Oil	75 - 85 (8.474 - 9.604)

AP-9 And AP-11 Borescope Plug Installation Data
Table 801

(9) Remove PWA 86441 Guide Tube from AP-8 port. Refer to 72-00-00 Inspection/Check-01D Task 72-00-00-210-020 and install the AP-8 plugs and gaskets per the installation data in Table 801.

ENGINE GENERAL − INSPECTION/CHECK−01F

Task 72−00−00−210−030:

1. Perform Borescope Inspection Of Stage 1 HPT Blades And Duct Segments (AP−8/AP−11)

A. Equipment And Materials Necessary

Standard Tools:

See 72−00−00 Inspection/Check−01A Task 72−00−00−990−011 for borescope equipment.

Consumable Materials:

Item No.	Designation
P03−001	Engine Oil (PWA 521B)
P05−289	Lockwire
P06−023	Thread Lubricant (PWA 36001 or PMC 9940)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	6	72−41−00/1/130A
Gasket AP−11	1	75−24−00/3/55

B. Procedure

(1) Remove the AP−8 access port plugs, as necessary, from the diffuser case as follows: See Figure 801 (Sheet 1) for AP−8 locations.

NOTE: Table 801 shows more specifications for the plugs at location AP−8.

(a) Cut the safety wire and remove the safety wire from the plugs that will be removed.

(b) Use a standard 3/8 socket drive extension and a breaker bar or ratchet to remove the AP−8 plugs.

(c) Remove the AP−8 plugs and gaskets, as necessary, for the examination of the stage 1 HPT vanes.

(d) Discard all the old gaskets.

Access Port & (Stage)	Angular Location Clockwise From Rear	Gasket P/N	Plug P/N	Plug Thread Lubricant	Plug Torque lb−in. (N.m)
AP−8	45° (1:30 o'clock)	512640	50A725	P06−023	40 − 50 (4.519 − 5.649)
AP−8	127° (4:30 o'clock)	512640	50A725	P06−023	40 − 50 (4.519 − 5.649)
AP−8	172° (6:00 o'clock)	512640	50A725	P06−023	40 − 50 (4.519 − 5.649)
AP−8	225° (7:30 o'clock)	512640	50A725	P06−023	40 − 50 (4.519 − 5.649)
AP−8	277° (9:00 o'clock)	512640	50A725	P06−023	40 − 50 (4.519 − 5.649)
AP−8	338° (11:00 o'clock)	512640	50A725	P06−023	40 − 50 (4.519 − 5.649)
For Engines Equipped:					
NOTE: If the high stage temp sensor was removed to borescope through the (338°C) 11:00 o'clock port, reinstall per Section 71−00−41, Installation−04.					
AP−11	Lower TCA Tube	ST 1142−011	50L509−01	P03−001	75 − 85 (8.474 − 9.604)

Borescope Access Port (AP−8 And AP−11) Data
Table 801

(2) For engines equipped, remove three bolts, plug and gasket from borescope access port AP−11 located on the lower turbine cooling air tube elbow at the 7 o'clock position. See Figure 801 (Sheet 2).

CAUTION: TEMPERATURES IN AREAS TO BE BORESCOPED SHOULD BE PERMITTED TO COOL TO BELOW 150°F (65.6°C) FOLLOWING ENGINE OPERATION. DAMAGE MAY RESULT TO BORESCOPE EQUIPMENT IF EQUIPMENT IS EXPOSED TO GASPATH OR METAL TEMPERATURES IN EXCESS OF 150°F (65.6°C). AS A GUIDE − IF ADJACENT CASES ARE TOO HOT TO TOUCH COMFORTABLY, INSPECTION SHOULD BE DELAYED.

(3) Insert the borescope through the port (AP−8 or AP−11) and inspect the Stage 1 blades for nicks, dents, cracks, tip damage, erosion, coating loss, liberated material, bent tips, tip rub, airfoil growth, blocked cooling holes, airfoil bulging and burning, sulfidation and damage caused by passage of foreign material. See Figure 803. To view each blade, rotate the high rotor using hand or power operated equipment. See 72−00−00 Inspection/Check−01A, Installation Of The Rotator Used To Turn The N2 Rotor, (Task 72−00−00−480−002).

NOTE: Conditions noted above are for each blade and unless otherwise stated all blades can exhibit conditions described within the limits given.

NOTE: Maximum borescope insertion depth and borescope limiting access hole diameter specifications for AP−8 and AP−11 are given in Table 801 of 72−00−00 Inspection/Check−01A, General Borescope Inspection Procedures And Borescope Access Port (AP) Data, Task 72−00−00−990−011.

(4) Borescope inspection limits for the Stage 1 HPT blades.

NOTE: Additional borescope recommendations for certain part number (configuration) high pressure turbine 1st stage blades are contained in SB PW4ENG 72−422. The information in SB PW4ENG 72−422 must be combined with the information that follows to form a complete inspection program for high pressure turbine 1st stage blades (applicable only to engines with 1st stage blades addressed by SB PW4ENG 72−422).

CAUTION: FOLLOWING LIMITS ARE APPLICABLE ON A CONTINUE−IN−SERVICE BASIS ONLY. LIMIT IS BASED ON PART STRUCTURAL REQUIREMENTS AND DOES NOT IMPLY THAT ENGINE PERFORMANCE, STABILITY, OPERATING

LIMITS, OR PART REPARABILITY WILL BE MAINTAINED.

(a) Limits for blade conditions observed during borescope inspection are given in Figure 802 through Figure 805.

NOTE: Additional borescope recommendations for certain part number (configuration) high pressure turbine 1st stage blades are contained in SB PW4ENG 72−422. The information in SB PW4ENG 72−422 must be combined with the information that follows to form a complete inspection program for high pressure turbine 1st stage blades (applicable only to engines with 1st stage blades addressed by SB PW4ENG 72−422).

(b) Blade cracking. The limits for blade cracking observed during borescope inspection are given in Figure 802 through Figure 805.

CAUTION: LOSS OF BLADE COATING MAY RESULT IN DEGRADATION OF THE BASE ALLOY. THIS CONDITION, AS WELL AS HOT CORROSION ATTACK (SULFIDATION), CAN AFFECT BLADE REPARABILITY.

(c) Airfoil bulging.

1 Inspect for concave side bulging. Using a flexible borescope through AP−11 it is possible to detect a bulge by keeping the borescope parallel and very close to the concave airfoil surface. Small bulges may be detectable by a shadow seen beyond the bulge. See Figure 804. Using a flexible borescope through AP−8 it may also be possible to detect larger bulges.

2 For engines not equipped with AP−11, or as an alternate method, inspect for concave side airfoil dark spots using a flexible borescope through AP−8. First stage HPT blades which have bulged airfoils typically exhibit a large dark spot in the region of the bulge. Dark spots extending forward of the fifth tip cooling hole are indicative of hot operating conditions, for the blade, which may result

in bulging. See Figure 805 for dark spot and fifth tip cooling hole identification.

(d) Blade erosion/corrosion.

NOTE: First indication of corrosion is circular shaped stains or markings on blade outer surfaces. Characteristic of sulfidation corrosive attack is a greenish to pale blue color. See the Standard Practices Manual, Section 70.

(5) Examine the HPT 1st stage duct segments for spalling (ceramic coating which is not there).

(a) All quantities of spalling are permitted.

(b) Ceramic spalling causes the conditions that follow:

1 Increased tip clearance of the HPT 1st stage blade.

2 Increased EGT.

3 Increased fuel consumption.

4 Possible damage to the tip of the HPT 1st stage blades.

5 Possible damage to the HPT 2nd stage blades.

(6) If the HPT 1st stage duct segments are spalled, do the inspection of the HPT 1st and 2nd stage blades for damage.

(7) After you complete the borescope inspection, install the AP−8 plugs as follows. For engines equipped, install the AP−11 plug, new gasket and three bolts by the information given in Table 801:

(a) Use a nylon brush to clean the old antigalling compound from the threads of each AP plug.

(b) Apply a thin layer of new antigalling compound to the threads and to the plug head washer contact surface area. See Table 801 for the necessary antigalling compound.

NOTE: Do not use Engine Oil P03−001 on the AP−8 plug threads.

(c) If you apply more antigalling compound than is necessary to the plug, remove the unwanted compound with a rag or cloth.

(d) Put a new gasket on each AP plug, as necessary. See Table 801 for the necessary gasket.

NOTE: Always use a new gasket or washer. Do not use an old gasket.

(e) Install the AP plugs and gaskets in the applicable borescope boss on the engine. See Table 801 for the necessary AP plug and gasket part numbers for each location. Use a standard socket drive extension and ratchet to turn each AP plug into the boss. Hand tighten the plug only with the ratchet wrench.

(f) Use a standard torque wrench to torque the AP plugs. See Table 801 for the necessary torque specifications.

(g) Safety all the AP−8 plugs with Lockwire P05−289.

NOTE: The AP−11 plug is self locking and does not need to safetied with lockwire.

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket AP−10	1	72−53−00/3/170
Gasket AP−11	1	75−24−00/3/55

B. Procedure

See Figure 801, Figure 802 and Figure 803.

(1) Remove lockwire, and two bolts from borescope access port AP−10 located in LPT case at 4:30 o'clock position. Using PWA 86081 Puller, remove (as an assembly), the boss plug, plug stop (cover), spring washer, and cotter pin. Discard the boss plug gasket.

(2) For engines equipped, remove three bolts, plug, and gasket from the AP−11 borescope access port located on the turbine cooling air tube elbow at the 7 o'clock position. See Table 801 of 72−00−00 Inspection/Check−01A, Task 72−00−00−990−010 for additional AP−10/AP−11 access port data.

CAUTION: TEMPERATURES IN AREAS TO BE BORESCOPED SHOULD BE PERMITTED TO COOL TO BELOW 150°F (65.6°C) FOLLOWING ENGINE OPERATION. DAMAGE MAY RESULT TO BORESCOPE EQUIPMENT IF EQUIPMENT IS EXPOSED TO GASPATH OR METAL TEMPERATURES IN EXCESS OF 150°F (65.6°C). AS A GUIDE − IF ADJACENT CASES ARE TOO HOT TO TOUCH COMFORTABLY, INSPECTION SHOULD BE DELAYED.

(3) Do a borescope inspection of the Stage 2 blades.

NOTE: Maximum borescope insertion depth and borescope limiting access hole diameter specifications for AP−10 and AP−11 are provided in Table 801 of 72−00−00 Inspection/Check−01A, General Borescope Inspection Procedures And Borescope Access (Task 72−00−00−990−010).

(a) Carefully insert the borescope through the port and inspect the Stage 2 blades.

(b) To view each blade, rotate high rotor using hand or power operated equipment.

(c) See 72−00−00 Inspection/Check−01A, for Installation Of The Rotator Used To Turn The N2 Rotor, (Task 72−00−00−480−001).

(4) Borescope inspection limits for Stage 2 blades

NOTE: Conditions noted below are per blade and unless otherwise stated all blades can exhibit conditions described within limits provided.

(a) Examine the blades for nicks, dents, cracks, tip damage, erosion, coating loss, liberated material, bent tips, tip rub, airfoil growth, blocked cooling holes, sulfidation and damage caused by passage of foreign material.

CAUTION: FOLLOWING LIMITS ARE APPLICABLE ON A CONTINUE−IN−SERVICE BASIS ONLY. LIMIT IS BASED ON PART STRUCTURAL REQUIREMENTS AND DOES NOT IMPLY THAT ENGINE PERFORMANCE, STABILITY, OPERATING

LIMITS, OR PART REPARABILITY WILL BE MAINTAINED.

(b) Limits for blade conditions, including blade cracking, observed during borescope inspection are given in Figure 802 (Sheet 3) for blade inspection areas, and Figure 803 (Sheet 1) through Figure 803 (Sheet 3) for inspection limits.

(c) Examine the Stage 2 blades for signs of blade tip displacement and related conditions. See Figure 802 (Sheet 3) for blade inspection areas, and Figure 803 (Sheet 4) for inspection limits. See Figure 804 which shows a typical displaced Stage 2 blade.

CAUTION: LOSS OF BLADE COATING MAY RESULT IN DEGRADATION OF THE BASE ALLOY. THIS CONDITION, AS WELL AS HOT CORROSION ATTACH (SULFIDATION), CAN AFFECT BLADE REPARABILITY.

(d) Blade erosion/corrosion.

NOTE: First indication of corrosion is circular shaped stains or markings on blade outer surfaces. Characteristic of sulfidation corrosive attack is a greenish to pale blue color. See the Standard Practices Manual, PN 585005, Section 70.

(5) Examine the HPT 2nd stage duct segments for spalling (ceramic coating which is not there).

(a) All quantities of spalling are permitted.

(b) Ceramic spalling causes the conditions that follow:

1 Increased tip clearance of the HPT 2nd stage blade.

2 Increased EGT.

3 Increased fuel consumption.

4 Possible damage to the tip of the HPT 2nd stage blades.

5 Possible damage to the HPT 2nd stage blades.

(6) If the HPT 2nd stage duct segments are spalled, do the inspection of the HPT 1st and 2nd stage blades for damage.

(7) After borescope inspection, install as an assembly, the AP-10 plug, spring tension washer, plug stop, cotter pin and a new gasket. Install gasket into boss with split facing inward. See Table 801 before you install this assembly.

NOTE: If plug, washer and plug stop (cover) have been disassembled, reassemble and install per step (9) procedure.

(8) If required, assemble AP-10 borescope plug, spring tension washer, plug stop (cover) and cotter pin as follows:

NOTE: When plug, spring tension washer and cover are properly assembled and installed to turbine case, plug should be loaded inward, by spring washer, to seat in case boss.

(a) Place washer into cover recess so that washer OD contacts cover and concave surface of washer is towards cover recess.

(b) Insert plug into cover and washer from washer side.

(c) Install cotter pin into hole in plug, with cotter pin head seated firmly on flat side of plug. Bend cotter pin prongs so that head and prongs are firmly seated against plug.

(d) Install new gasket, split facing inward, into borescope boss on turbine case.

(9) Secure plug stop to AP-10 boss.

(a) Thoroughly clean bolt threads and AP-10 boss threads with Petroleum Solvent P11-027 to remove carbon deposits and any deposits of the before
R you apply Anti-Seize Paste P06-054. Remove the
R unwanted paste.

(b) Treat threads of two bolts with Silver Goop P06-023. Remove excess compound.

(c) Secure plug to AP-10 borescope boss on case with two bolts (above). Torque and lockwire bolts per Table 801.

(10) For engines equipped, install AP-11 plug and a new gasket per the requirements of Table 801.

AP Number And Location	Gasket Required	Bolt(2) Locking Method	Bolt(2) Replacement Lubricant	Bolt(2) Torque lb-in. (N.m)
AP-10 Stage 2 HPT Blades	Yes PN ST1146-08	Lockwire (MS9226-04)	P06-023 Silver Goop	54 - 60 (6.101 - 6.779)
AP-11 Lower TCA Tube	Yes PN ST1142-011 (Gasket)	Self Locking	P03-001 Engine Oil	75 - 85 (8.474 - 9.604)

Task 72-00-00-210-007:

1. Perform Borescope Inspection Of Stage 3 LPT Vanes (AP-10)

A. Equipment And Materials Required

Standard Tools:

See Inspection/Check-01A for borescope equipment.

Special Tools:

PWA 86081	Puller, AP-10 Borescope Plug Assembly

Consumable Materials:

Item No.	Designation
P06-023	Silver Goop (PWA 36001)
P11-027	Petroleum Solvent (PMC 9001)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	72-53-00/3/120
Lockwire	1	72-53-00/3/160

B. Procedure

See Figures 801, 802 and 803.

(1) Remove lockwire, and two bolts from borescope access port AP-10 located on LPT case at 4:30 o'clock position. Using PWA 86081 Puller, remove (as an assembly), the boss plug, plug stop (cover), spring washer, and cotter pin. Discard gasket on boss plug.

CAUTION: TEMPERATURES IN AREAS TO BE BORESCOPED SHOULD BE PERMITTED TO COOL TO BELOW 150°F (65.6°C) FOLLOWING ENGINE OPERATION. DAMAGE MAY RESULT TO BORESCOPE EQUIPMENT IF EQUIPMENT IS EXPOSED TO GASPATH OR METAL TEMPERATURES IN EXCESS OF 150°F (65.6°C). AS A GUIDE - IF ADJACENT CASES ARE TOO HOT TO TOUCH COMFORTABLY, INSPECTION SHOULD BE DELAYED.

(2) Insert borescope through port and inspect Stage 3 vanes for nicks, dents, cracks and other damage caused by passage of foreign material. See Figure 802 for inspection limits.

(a) If there has been a sudden increase in EGT, check for a possible missing or liberated LPT 3rd stage outer transition duct segment. No missing or liberated outer transition duct segments are permitted.

NOTE: Maximum borescope insertion depth and borescope limiting access hole diameter specifications for AP−10 are provided in Table 801, 72−00−00 Inspection/Check−01A Task 72−00−00−990−010.

(3) After borescope inspection, install as an assembly, the AP−10 plug, spring tension washer, plug stop, cotter pin and a new gasket. Install gasket into boss with split facing inward. See Table 801 and Figure 803 before installing this assembly.

NOTE: If plug, washer and plug stop (cover) have been disassembled, reassemble per step (4) procedure.

AP Number And Location	Gasket Required	Bolt(2) Locking Method	Bolt(2) Replacement Lubricant	Bolt(2) Torque lb−in. (N.m)
AP−10 Stage 3 LPT Vanes	Yes PN ST1146−08	Lockwire (MS9226−04)	P06−023 Silver Goop	54 − 60 (6.101 − 6.779)

AP−10 Borescope Plug Installation Data − Table 801

(4) If required, assemble borescope plug, spring tension washer, plug stop (cover) and cotter pin.

NOTE: When plug, spring tension washer and cover are properly assembled and installed to turbine case, plug should be loaded inward, by spring washer, to seat in case boss.

(a) Place washer into cover recess so that washer OD contacts cover, and concave surface of washer is towards cover recess.

(b) Insert plug into cover and washer from washer side.

(c) Install cotter pin into hole in plug, with cotter pin head seated firmly on flat side of plug. Bend cotter pin prongs so that head and prongs are firmly seated against plug.

(d) Install new gasket, split facing inward, into borescope boss on turbine case.

(5) Install plug stop to boss and torque bolts.

(a) Thoroughly clean bolt threads and AP−10 boss threads with Petroleum Solvent P11−027 to remove carbon deposits and any deposits of previously applied antigalling compound.

(b) Treat threads of two bolts with Silver Goop P06−023. Remove excess compound.

(c) Secure plug to AP−10 borescope boss on case with two bolts (above). Torque and lockwire bolts per Table 801.

Loss Of Coating	Any quantity	Any quantity
Burning And Erosion	Any quantity to 0.020 inch (0.508 mm) depth and 0.300 inch (7.620 mm) diameter maximum.	Any exceedance of serviceable limit.
Sulfidation	None	A single area on each blade to 0.200 square inch (5.080 mm^2). There can not be any associated crack or material loss. Five blades maximum on each rotor can have sulfidation to the above limits.
INSPECT AREA D FOR: (See Figure 801)		
Cracks, Tears	None	A tight radial crack or tear to 0.100 inch (2.540 mm) maximum length.
Nicks	Any quantity to 0.015 inch (0.381 mm) maximum depth.	Any quantity to 0.050 inch (1.270 mm) maximum depth.

Stage 3 LPT Blade Borescope Inspection Limits
Table 801 (Continued)

INSPECT	SERVICEABLE LIMITS	REMOVE ENGINE WITHIN 5 CYCLES LIMITS
Dents (Round Bottom)	Any quantity to 0.020 inch (0.508 mm) maximum depth 0.125 inch (3.175 mm) diameter metal displacement.	Any quantity to 0.050 inch (1.270 mm) maximum depth.
Loss Of Coating	Any quantity	Any quantity
Burning And Erosion	Any quantity to 0.020 inch (0.508 mm) depth and 0.300 inch (7.620 mm) diameter maximum.	Any exceedance of serviceable limit.
Sulfidation	None	A single area on each blade to 0.200 square inch (5.080 mm^2). There can not be any associated material loss. Five blades maximum on each rotor stage can have sulfidation to the above limits.

CAUTION: WHERE DAMAGE EXCEEDS THE SERVICEABLE LIMITS AND PART FAILURE OR MATERIAL LIBERATION IS IMMINENT, REMOVE ENGINE IMMEDIATELY.

INSPECT BLADE AREA E FOR:
(See Figure 801)

Cracks, tears	None	None
Nicks	Any quantity to 0.015 inch (0.381 mm) maximum depth.	Any quantity to 0.050 inch (1.270 mm) maximum depth.

Stage 3 LPT Blade Borescope Inspection Limits
Table 801 (Continued)

INSPECT	SERVICEABLE LIMITS	REMOVE ENGINE WITHIN 5 CYCLES LIMITS
Dents (round−bottomed, a scuffed surface texture is acceptable)	Any quantity less than 0.100 inch (2.54 mm) diameter to a 0.020 inch (0.508 mm) depth or a single dent 0.100 inch (2.54 mm) to 0.500 inch (12.7 mm) diameter to a 0.030 inch (0.762 mm) depth.	Any exceedance of serviceable limit.
Loss of coating	Any quantity	
Burning and erosion	Any quantity to 0.020 inch (0.508 mm) depth and 0.300 inch (7.620 mm) diameter maximum.	Any exceedance of serviceable limit.
Sulfication	None	A single area on each blade to 0.200 square inch (5.080 mm^2). There can not be any associated crack or material loss. Five blades maximum on each rotor can have sulfication to the above limits.

Stage 3 LPT Blade Borescope Inspection Limits
Table 801 (Continued)

C. Procedure

ENGINE GENERAL − INSPECTION/CHECK−01I

(1) Remove lockwire, and two bolts from borescope access port AP−10 located on LPT case at 4:30 o'clock position. Using PWA 86081 Puller, remove (as an assembly), the boss plug, plug stop (cover), spring washer, and cotter pin. Discard gasket on boss plug.

CAUTION: TEMPERATURES IN AREAS TO BE BORESCOPED SHOULD BE PERMITTED TO COOL TO BELOW 150°F (65.6°C) FOLLOWING ENGINE OPERATION. DAMAGE MAY RESULT TO BORESCOPE EQUIPMENT IF EQUIPMENT IS EXPOSED TO GASPATH OR METAL TEMPERATURES IN EXCESS OF 150°F (65.6°C). AS A GUIDE − IF ADJACENT CASES ARE TOO HOT TO TOUCH COMFORTABLY, INSPECTION SHOULD BE DELAYED.

(2) Insert borescope through port and inspect Stage 3 blades for nicks, dents, cracks and other damage caused by passage of foreign material. See Figure 801 and Table 801 for inspection limits.

(a) If there has been a sudden increase in EGT, check for a possible missing or liberated LPT 3rd stage outer transition duct segment. No missing or liberated outer transition duct segments are permitted.

NOTE: Maximum borescope insertion depth and borescope limiting access hole diameter specifications for AP−10 are provided in Table 801, 72−00−00 Inspection/Check−01A Task 72−00−00−990−010.

(3) After borescope inspection, install as an assembly, the AP−10 plug, spring tension washer, plug stop, cotter pin and a new gasket. Install gasket into boss with split facing inward. See Figure 803 and Table 801, 72−00−00 Inspection/Check−01H Task 72−00−00−210−007 before you install this assembly.

NOTE: If plug, washer and plug stop (cover) have been disassembled, reassemble per step (4) procedure.

(4) If required, assemble borescope plug, spring tension washer, plug stop (cover) and cotter pin.

NOTE: When plug, spring tension washer and cover are properly assembled and installed to turbine case, plug should be loaded inward, by spring washer, to seat in case boss.

(a) Place washer into cover recess so that washer OD contacts cover, and concave surface of washer is towards cover recess.

(b) Insert plug into cover and washer from washer side.

(c) Install cotter pin into hole in plug, with cotter pin head seated firmly on flat side of plug. Bend cotter pin prongs so that head and prongs are firmly seated against plug.

(d) Install new gasket, split facing inward, into borescope boss on turbine case.

(5) Install plug stop to boss and torque bolts.

(a) Thoroughly clean bolt threads and AP−10 boss threads with Petroleum Solvent P11−027 to remove carbon deposits and any deposits of previously applied antigalling compound.

(b) Treat threads of two bolts with Silver Goop P06−023. Remove excess compound.

(c) Secure plug to AP−10 borescope boss on case with two bolts (above). Torque and lockwire bolts per Table 801, 72−00−00 Inspection/Check−01H Task 72−00−00−210−007.

ENGINE GENERAL − INSPECTION/CHECK−01J

Task 72−00−00−230−001:

1. Perform Dye Penetrant Inspection Of Stage 1 HPT Blades, Stage 2 HPT Blades And Stage 3 LPT Vanes − Deleted

NOTE: This inspection procedure has been deleted.

Previous Pageblock Return to Previous Menu Next Pageblock

ENGINE GENERAL - INSPECTION/CHECK-01K

Task 72-00-00-210-008:

1. Perform Visual Inspection Of Stage 6 LPT Blades And Stage 6 LPT Vanes

   A. Equipment And Materials Required - None

   B. Inspect Stage 6 LPT Blades For Damage Per Limits Given In Figure 801.

   NOTE: Inspection of Stage 6 LPT blades in accomplished by looking forward through turbine exhaust area.

   C. Inspect Stage 6 LPT Vanes For Damage Per Limits Given In Figure 802.

   NOTE: Inspection of Stage 6 LPT vanes is accomplished by looking forward through turbine exhaust area and Stage 6 LPT blades.

   (1) Inspect the visible areas of the vane trailing edge, shrouds and airfoil for damage. See Areas A, B, C and D on Figure 802.

   NOTE: Only one airfoil side, shrouds and trailing edge are visible. If damage is present on the visible areas of the vane, a complete inspection of the vane should be accomplished. This should be done utilizing a borescope, mirrors or other necessary tooling to observe the vane leading edge and remainder of the airfoil surfaces. (Borescope tooling is provided in Paragraph 1.) Inspection/Check-01A.

Task 72−00−00−210−024:

1. Perform Visual Inspection Of The Stage 6 LPT (Outer) Airsealing Ring Segment Assembly
   - A. Equipment And Materials Required − None
   - B. Procedure

     See Figure 801.
     - (1) Make an inspection of the Stage 6 LPT (outer) airsealing ring segment assemblies.
       - (a) Damage that is next to the wear groove and is greater than 3.0 inches (76.200 mm) in length in each segment, unlimited segments, is not permitted.

         NOTE: Make an inspection of the Stage 6 LPT (outer) airsealing ring segment assemblies by looking forward through the turbine exhaust case.

         An increase in segment damage will show a decrease in performance.

       - (b) If it is necessary to remove the airsealing ring, remove the engine.

ENGINE GENERAL - INSPECTION/CHECK-01M

Task 72-00-00-210-009:

1. Perform Visual Inspection Of Turbine Exhaust Case

A. Equipment And Materials Necessary - None

B. General

(1) The regular inspection interval referred to in this procedure is obtained from the Maintenance Planning Guide. The reduced inspection interval is set at half that value. These inspection intervals may be adjusted based on operator experiences and consultation with the local regulatory agency.

C. Case Exterior Inspection For Cracks And Damage See Figure 801 and Figure 802.

NOTE: All cracks should be repaired at next removal of turbine exhaust case from engine.

(1) Case rail flange inspection. See Figure 802 and Table 801.

INSPECTION AREA AND OBSERVED CONDITION	MAXIMUM DAMAGE PERMITTED FOR A REGULAR INTERVAL INSPECTION	MAXIMUM DAMAGE PERMITTED FOR A REDUCED INTERVAL INSPECTION
Flanges R and S Rail cracks (See Figure 802, View B)	1. Radial or circumferential cracks to 0.75 inch (19.050 mm) in length are permitted.	1. Radial or circumferential cracks 1.5 inches (38.100 mm) length permitted. No axial cracks into the fillet radius permitted.
	2. Cracks at the same circumferential location are NOT permitted on adjacent rails.	2. Cracks at the same circumferential locations are NOT permitted on adjacent rails.
	3. No circumferential or axial cracks permitted in the fillet radius.	3. Single circumferential cracks to 1.0 inches (25.400 mm) confined to fillet radius

Turbine Exhaust Case (Exterior) Inspection Limits
Table 801

INSPECTION AREA AND OBSERVED CONDITION	MAXIMUM DAMAGE PERMITTED FOR A REGULAR INTERVAL INSPECTION	MAXIMUM DAMAGE PERMITTED FOR A REDUCED INTERVAL INSPECTION
(CONTINUED)		permitted.
Flanges R and S Engine mount ground handling mount, rail slots and through hole cracks. (See Figure 802, View A & D)	1. A single radial crack in a slot to the rail OD is permissible.	1. A single radial or circumferential crack on the ID side of a slot or through hole is permitted to a maximum length of 1.0 inch (25.400 mm).
	2. Cracks from engine mount bushing hole or ground handling bushing holes at 10:30, 11:30, 12:30 and 1:30, 3:00 and 9:00 o'clock positions are NOT permitted.	
Flanges P and T, T1 OD Flanges And ID Flange T1 (See Figure 801)	1. Radial crack from flange OD to bolt hole permitted.	1. Radial crack from flange OD to bolt bolt hole inward to the fillet radius is permitted. NO cracks in the fillet radius.
	2. Radial crack from the bolt hole running inward is NOT permitted.	

Turbine Exhaust Case (Exterior) Inspection Limits
Table 801 (Continued)

(a) Visually inspect Flanges R and S for cracks and damage. Maximum permissible damage and crack conditions for Regular Interval or Reduced Interval inspections are defined in Table 801.

(2) Case outer flange inspection. See Figure 801 and Table 801.

(a) Visually inspect Flanges P and T for cracks and damage. Maximum permissible damage and crack conditions for Regular Interval or Reduced Interval inspections are defined in Table 801.

D. Turbine Exhaust Case Gaspath Area Inspection

(1) General Damage − Nicks, Dents And Cracks

(a) Turbine exhaust case strut and duct inspection. Turbine exhaust case struts having surface skin bulges or depressions, buckling and distorted leading and/or trailing edges may continue−inservice provided following limits are not exceeded.

1 Leading and trailing edge contours are smooth and crack limits do not exceed Paragraph (2).

2 Skin separation from strut stiffeners is not allowed.

3 Angular dents appearing as a straight line crease, holes and tears, are to be treated as cracks. Length of crease, hole or tear to be added to length of cracks when assessing acceptance.

NOTE: Acceptable cracking in vanes may allow hot exhaust gases to flow through vanes into surrounding cowled area. Inspection of engine/aircraft services (tubes and cables) in this area is recommended as part of the overall inspection for continued operation.

(2) Turbine exhaust case strut and duct crack limits. See Figure 803, Figure 804, Figure 805, Figure 806 and Figure 807.

(a) Turbine exhaust case struts, and OD and ID duct area crack limits are defined in Table 802.

INSPECTION AREA AND OBSERVED CONDITION	MAXIMUM DAMAGE PERMITTED FOR A REGULAR INTERVAL INSPECTION	MAXIMUM DAMAGE PERMITTED FOR A REDUCED INTERVAL INSPECTION
	(See Figure 804)	(See Figure 806)
Strut airfoil and trailing edge area for cracks	1. Three cracks maximum on a single strut over .75 inch (19.050 mm)	1. Three cracks maximum on a single strut over 1.25 inches (31.750 mm). One crack maximum over 1.75 inches (44.450 mm).

Turbine Exhaust Case (Gaspath Area) Inspection Limits
Table 802

INSPECTION AREA AND OBSERVED CONDITION	MAXIMUM DAMAGE PERMITTED FOR A REGULAR INTERVAL INSPECTION	MAXIMUM DAMAGE PERMITTED FOR A REDUCED INTERVAL INSPECTION
(CONTINUED)		
	2. Radial cracks 1.25 inches (31.750 mm) maximum permitted.	2. Radial (spanwise) and axial (chordwise) cracks to a maximum of 2.5 inches (63.500 mm) in length permitted on airfoil areas. Cracks can pass through the fillet radius or leading edge.
	3. Axial cracks through the airfoil to leading edge, 1.25 inches (31.750 mm) maximum permitted.	3. NO "U" shaped cracks or impending material liberation permitted.
	4. Any number of cracks under .75 inch (19.050 mm) confined to airfoil area only, are permitted.	4. Total cumulative length of all cracks must not exceed 5.00 inches (127.000 mm).
	5. Cracks permitted to enter leading edge or fillet radius	
	6. NO "U" shaped cracks or impending material liberation permitted.	
Strut leading edge area for cracks	(See Figure 804) 1. Radial crack on, or adjacent to strut leading edge weld, to a maximum of 1.25 inches (31.750 mm). Crack must NOT enter ID or OD fillet radius.	(See Figure 806) 1. Radial crack on or adjacent to strut leading edge weld to a maximum of 2.5 inches (63.500 mm). Crack can pass through the fillet radius.
	2. Axial or

Table 802 (Continued)

INSPECTION AREA AND OBSERVED CONDITION	MAXIMUM DAMAGE PERMITTED FOR A REGULAR INTERVAL INSPECTION	MAXIMUM DAMAGE PERMITTED FOR A REDUCED INTERVAL INSPECTION
(CONTINUED)		
	chordwise crack through the leading edge to the airfoil surface permissible. Length of airfoil area crack applies.	
Strut for cracks	(See Figure 804) 1. Radial cracks to a maximum of two, per strut can pass through the fillet radius. The maximum length is 1.25 inches (31.750 mm) and includes any portion of the crack on the airfoil or duct surfaces.	(See Figure 806) 1. Radial cracks to a maximum of two per strut can pass through the fillet radius. The maximum length is 2.5 inches (63.500 mm) and includes any portion of the crack on the airfoil or duct surfaces.
	2. Axial crack along the airfoil ID or OD weld line to 1.25 inches (31.750 mm) maximum. One crack per strut. Crack cannot pass around leading edge.	2. Axial crack along the airfoil ID or OD weld line to 2.5 inches (63.500 mm) maximum. One crack per strut. Crack can pass around leading edge.
Struts inner trailing edge stand−up. Area C	Crack up to 1.00 inch (25.400 mm) long from trailing edge.	Crack up to 2.00 inch (50.800 mm) long from trailing edge.
Struts outer trailing edge stand−up. Area D	Crack up to 1.25 inch (31.750 mm) long from trailing edge.	Crack up to 2.5 inches (63.500 mm) long from trailing edge.

Turbine Exhaust Case (Gaspath Area) Inspection Limits
Table 802 (Continued)

INSPECTION AREA AND OBSERVED CONDITION	MAXIMUM DAMAGE PERMITTED FOR A REGULAR INTERVAL INSPECTION	MAXIMUM DAMAGE PERMITTED FOR A REDUCED INTERVAL INSPECTION
Inner and outer duct areas for cracks	(See Figure 805)	(See Figure 807)
	1. Circumferential or axial cracks to a maximum length of 1.25 inches (31.750 mm) with a maximum quantity of three.	1. Circumferential or axial cracks to a maximum length of 2.5 inches (63.500 mm) with a maximum quantity of three.
	2. A continuous crack or two intersecting cracks maximum between any two struts considered to be a single crack. NO "U" shaped cracks or impending material liberation permitted.	2. A continuous crack or two intersecting cracks maximum between any two struts are to be considered a single crack.
	3. Three cracks maximum between any two adjacent struts, over .75 inch (19.050 mm). Maximum length is 1.25 inches (31.750 mm).	3. NO "U" shaped cracks or impending material liberation is permitted.
	4. Any number of cracks under .75 inch (19.050 mm) confined to duct area only, are permitted.	
		5. Three cracks maximum between any two struts over 1.25 inches (31.750 mm). The maximum length is 2.5 inches (63.500 mm).

ENGINE GENERAL - INSPECTION/CHECK-02

Task 72-00-00-210-001:

1. Inspect The Turbine Cooling Air (TCA) System And The Turbine Case Cooling (TCC) System

A. Equipment And Materials Required - None

B. Inspect Manifolds And Tubes

(1) Visually inspect manifolds for cracks, nicks and dents.

(a) No cracks or nicks are permitted.

(b) Dents are permitted in any quantity provided they are round bottom and exhibit no sharp edges or corners.

(2) Visually inspect supply tubes for cracks, nicks and dents.

(a) Cracks or nicks are not acceptable.

(b) Dents are permitted in any quantity provided they are round bottom and exhibit no sharp edges or corners.

(3) Inspect manifolds and tubes for chafing and corrosion.

(a) Chafing up to maximum of 0.004 inch (0.102 mm) deep present on any manifold is acceptable.

(b) Corrosion up to maximum of 0.004 inch (0.102 mm) deep present on any manifold is acceptable.

C. Inspect Supports And Clamps

(1) Evidence of looseness, cracks or damage to cushion material is acceptable within limits specified below.

(a) Looseness of supports or clamps attached to the manifolds is not acceptable and must be corrected.

(b) Inspect supports and clamps for cracks. None are acceptable.

(c) Inspect clamps for damage to cushion material. Any extent is acceptable unless looseness or chafing occur.

D. Inspect Valves, Solenoids, And Actuators
See Figure 801 and Figure 802.

(1) Functional checks − see appropriate Component Maintenance Manual.

(2) Physical inspection of supports/brackets.

(a) Looseness of supports/brackets attached to any valve/solenoid is not acceptable and must be corrected.

(3) Examine the valves, solenoids and actuators for condition and serviceable installation.

(4) Examine the position indication pin in each turbine vane and blade cooling air valve. See Figure 801.

NOTE: Valves are spring loaded open when not in operation.

(a) An extended pin shows the valve is fully open (normal condition).

(b) If the pin is not fully extended, the valve is not fully open. Replace valve.

E. Inspect The Turbine Case Cooling (TCC) Control System And Linkage.
See Figure 803.

NOTE: Use this check to:

- Do a general inspection when a damaged or defective component is not suspected.
- Do a general inspection without any disassembly.
- Also see the check in Paragraph F when you do suspect improper operation of the system.

(1) Examine the clamps that attach the actuator to the bracket for looseness, wear, and cracks. Replace the clamps if necessary.

(2) Examine the clamps that attach the control cable to the brackets for looseness, wear, and cracks. Replace the clamps if necessary.

(3) Examine the cable rod end and the adjuster rod ends for wear. If you find any worn rod end, replace the rod end and adjust the system per 72-00-00, Special Procedures-11 Task 72-00-00-830-005.

(4) Examine the cable rod end and the adjuster rod ends that they are correctly attached.

(5) Examine the air valves and be sure that the valves are in the full closed (shut down) position.

F. Inspect Turbine Case Cooling Control (TCC) System And Linkage
See Figure 803.

NOTE: Use this check and the check in Paragraph E. to:

- Find any secondary damage caused by a known defective component
- Find the cause of damage to a component.

NOTE: Use the check in Paragraph E. to:

- Do a general inspection when a damaged or defective component is not suspected
- Do a general inspection without any disassembly.

(1) Remove the bolt and nut that attach the cable rod end to the idler arm.

(2) Manually pull the cable rod end rearward. If the cable rod end separates from the cable, the shear pin is defective. If necessary, replace the cable per 72-00-53, Removal-06 Task 72-00-53-050-004 and 72-00-53, Installation-06 Task 72-00-53-450-004.

(3) Remove the two bolts, nuts, and front bushing that attach the adjuster to the valve lever arms.

(4) Examine the adjuster rod end bearings for wear and if the bearings turn freely in the rod ends. If necessary, replace the adjuster rod ends as follows.

(a) Remove lockwire and loosen the applicable jamnut. Replace the rod end and jamnut.

(b) Adjust and rig the system per Special Procedures-06 Task 72-00-00-830-004.

(5) Examine the idler arm for wear and see if it turns freely on the valve shaft. If not, replace the idler arm or bearing as follows.

(a) Remove the nut that attaches the idler arm with the bearing and retaining ring. Remove the arm. If equipped with a spacer replace the nut on the shaft and tighten by hand.

(b) Remove the retaining ring and bearing from the idler arm.

(c) Replace the defective part and install the bearing to the arm. Install the retaining ring.

(d) Remove the nut from the shaft. Install the arm, and if equipped with the spacer in position. Install the nut, lubricated with Engine Oil P03-001. Torque the nut to 36 - 40 lb-in. (4.067 - 4.519 N.m). Adjust and rig the system per Special Procedures-06 Task 72-00-00-830-004.

(6) Manually turn the HPT and LPT valve lever arms clockwise to the full open position. Release the lever arms and be sure the valves go back to full closed position. If a lever arm does not go back or does not turn freely, replace the defective valve. See 72-00-52, Removal-04 Task 72-00-52-050-001 and Installation-04 Task 72-00-52-450-001 or 72-00-53, Removal-07 Task 72-00-53-050-001 and Installation-07 Task 72-00-53-450-001 as applicable.

(7) If the control cable or the actuator is suspected of seizure, do as follows.

(a) Remove the actuator per 72-00-35, Removal-05 Task 72-00-35-050-002.

(b) Use the soft drift and manually push the piston shaft into the actuator. If the shaft does not move freely or does not come back, replace the actuator per 72-00-35, Installation-05 Task 72-00-35-450-002.

(c) Manually push and pull the control cable for the full travel. If the cable does not move freely, replace the cable per 72-00-53, Removal-06 Task 72-00-53-050-004 and 72-00-53, Installation-06 Task 72-00-53-450-004.

(8) If the adjustment of the system is suspected of being off, check the rigging per Special Procedures−06 Task 72−00−00−830−004.

(9) Install the adjustor assembly as follows.

(a) Install the bushing (flange outward) to the outside of the idler arm bolt hole.

(b) Position the adjustor assembly to the valve lever arm and the idler arm.

(c) Attach the adjustor assembly with two bolts, lubricated with Engine Oil P03−001, and nuts. Torque the nuts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

NOTE: Install the bolts from the inside of the arms.

(10) Attach the cable rod end to the inside of the idler arm with the bolt, lubricated with Engine Oil P03−001. Install the nut and torque it to 36 − 40 lb−in. (4.067 − 4.519 N.m).

NOTE: Install the bolt from the inside of the rod end.

G. Examine Electrical Harnesses For Signs Of Rub, Wear, And/Or Loose Connectors. Replace As Required.

NOTE: See Installation−00 Task 72−00−00−990−009 for the torque procedure if you find any loose connectors.

Task 72-00-00-280-053:

1. Perform Oil Overtemperature Inspection

A. Equipment And Materials Required

Standard Tools:
0.190-32 Jackscrews (8 Required) (Post SB PW4ENG 72-385)
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 85307	Puller, Jackscrew
PWA 85518	Puller
PWA 86018	Adapter, Oil Sampler

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
R P06-054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	72-54-00/5/90
Packing	1	72-62-00/3/130
Packing	1	79-22-00/3/1
Packing	1	79-23-00/2/1

B. Introduction

(1) See Table 801 for necessary procedures.

Range Of High Oil Temperature	Length Of High Temperature	Conditions of Engine Operation	Steps You Must Do Before You Can Use The Engine
325° - 350°F (163° - 177°C)	Less than 20 minutes	During a change from high power*	(1) None. Engine operation is correct.

Table 801

Range Of High Oil Temperature	Length Of High Temperature	Conditions of Engine Operation	Steps You Must Do Before You Can Use The Engine
325° − 350°F 163° − 177°C)	More than 20 minutes	Steady state operation	(1) Do "Inspections For Moderately High Temperature" (2) Correct the cause of the problem
351° − 400°F (177° − 204°C)	Any length of time	Any conditions of operation	(1) Correct any damage that the high temperature caused.
400°F + (204.4°C)+	Any length of time	Any conditions of operation	(1) Do "Inspections For Moderately High Temperature" (2) Do "Inspections For Very High Temperature" (3) Correct the cause of the problem (4) Correct any engine damage that the high temperature caused.

*High oil temperature and low fuel flow

Table 801 (Continued)

C. Inspections For Moderately High Temperature

(1) Examine the data from the aircraft indicating system that is related to:

(a) The engine oil system.

(b) The integrated−drive generator system (IDGS).

(2) Examine the instruments for correct operation.

(3) Do 71−00−00, Testing−07 Task 71−00−00−760−038.

(a) Examine the results for EEC/fuel/oil system defects.

(4) Do a check of the fuel/oil-cooler bypass valve.

(a) Remove the old valve. Install a new one. Refer to 72-00-35, Removal-11 Task 72-00-35-050-008 and 72-00-35, Installation-11 Task 72-00-35-450-008.

(b) Do 71-00-00, Testing-04 Task 71-00-00-760-031.

1 Do not do the acceleration/deceleration test.

2 Write down the new oil temperature data.

(c) Compare the new oil temperature data:

1 With the data from before replacement of the valve.

2 With the data from an engine which has correct temperature.

(d) If the oil temperature data from the test are satisfactory, the removed bypass valve was defective.

(5) Examine the engine air/oil heat exchanger and valve for satisfactory operation. See Figure 801.

(a) Disconnect W3P17. When W3P17 is disconnected, the valve is in the "open" position.

(b) Do 71-00-00, Testing-04 Task 71-00-00-760-031.

1 Do not do the acceleration/deceleration test.

2 Write down the new oil temperature data.

(c) Compare the new oil temperature data:

1 With the data from before W3P17 was disconnected.

2 With the data from an engine which has correct temperature.

(d) If the oil temperature data from the test are much better than the data from before, the valve is defective. Refer to 72-00-34, Removal-11 (Task 720034050008) and Installation-11 (Task 72-00-34-450-008) for replacement of the valve.

(6) Examine the oil system for contamination. Do Inspection/Check-04 (Task 72-00-00-280-054).

(a) Do not do the "Hydraulic Fluid Contamination Inspection".

NOTE: The procedures to drain and flush that are in Inspection/Check-04 are also in the procedures that follow. You will want to schedule operations to keep to a minimum the number of times you do the same operation.

(7) Get a sample of oil.

(a) Use PWA 86018 Adapter as follows:

1 Remove the magnetic chip detector assembly in the oil tank. Refer to 72-00-61, Removal-36 (Task 72-00-61-050-017).

2 Install PWA 86018 Adapter in the hole for the magnetic chip detector assembly.

3 Get a sample of oil.

(b) Examine the oil. If the answer to the three questions that follow is "no", do not continue the inspections. If the answer to any of the questions is "yes", do all the inspections in this section. Refer to SB PW4ENG 238 for oil quality limits.

1 Look at the color. Is the oil much darker than usual?

2 Is the oil more viscous?

3 Has the Total Acid Number (TAN) increased?

(c) Examine the main gearbox for discoloration, distortion, and burned areas. None is permitted. If there is any indication of this type of damage, remove and repair the engine.

(d) Drain the engine. Do 72-00-00, Servicing-01 Task 72-00-00-610-001.

NOTE: The procedures that follow will let you examine the engine for coke and deterioration of packings. Coke and packings with deterioration are possible indications of clogged oil nozzles or defective carbon seal assemblies. These two conditions can cause high oil temperature.

(e) Look in the angle gearbox. See Figure 802 and Figure 803.

1 Open the angle gearbox.

a Remove the liner segment that is below the angle gearbox. Refer to 72-00-33, Removal-16 Task 72-00-33-040-001.

b Remove the retaining ring that keeps the plug in the angle-gearbox cover-assembly installed.

c Remove the plug. Use PWA 85518 Puller.

2 Examine the internal part of the angle gearbox.

a Examine the packing that is on the plug for deterioration.

b Examine the gears for coke.

3 If you find coke, the No. 1, 1.5 and 2 bearing compartment carbon seals and/or oil nozzles are possibly damaged. Remove and repair the engine.

4 If you do not find coke, close the angle gearbox.

a Lubricate a new packing for the plug with Engine Oil P03-001.

b Install the packing on the plug.

c Install the plug in the angle-gearbox cover assembly.

d Install the retaining ring.

e Install the liner segment that is at 6 o'clock. Refer to 72-00-33, Installation-16 Task 72-00-33-440-001.

(f) Look in the No. 4 bearing compartment. See Figure 804.

1 Open the No. 4 bearing compartment.

a Remove the bolts (804/3) that attach the No. 4 bearing shield (804/4) to the rear inner flange of the turbine exhaust case. Remove the shield (804/4).

b Remove the No. 4 bearing heat shield (804/5).

2 Open the No. 4 bearing compartment.

a Remove the bolts (804/3) that attach the No. 4 bearing shield (804/4) to the rear inner flange of the turbine exhaust case. Remove the shield (804/4).

b Remove the No. 4 bearing heat shield (804/5).

c For No. 4 bearing cover (804/2) that has six small threaded holes (Pre SB PW4ENG 72-385), install the PWA 85307 Jackscrew Puller to the rear inner bolt hole flange (Flange T1) of the exhaust case and attach with two bolts, washers and nut details. Install the small plate of the puller to the six threaded holes in the cover and attach with six knurled screw details. Turn the jackscrew to disengage the cover from the exhaust case. Remove the puller and the cover from the exhaust case. Remove the cover from the puller. Discard the packing (804/1).

d For No. 4 bearing cover (804/2) that has eight jackscrew holes (Post SB PW4ENG 72-385), install and evenly tighten eight 0.190-32 jackscrews to remove the cover. Discard the packing (804/1).

3 Examine the internal part of the No. 4 bearing compartment.

a Examine the packing for signs of deterioration.

b Examine the cover for signs of coke.

c Look in the compartment for signs of coke.

4 If you find coke, the No. 4 bearing carbon seal and/or oil nozzle is possibly damaged. Remove and repair the engine.

CAUTION: YOU MUST APPLY ENGINE OIL FULLY TO THE COVER PACKING OR YOU WILL CUT THE PACKING DURING INSTALLATION. A CUT PACKING WILL CAUSE SUBSEQUENT OIL LOSS AND CAN CAUSE AN IN-FLIGHT SHUTDOWN.

CAUTION: INSTALL THE COVER INTO POSITION USING FOUR WORK BOLTS EQUALLY SPACED AROUND THE COVER. TIGHTEN THE BOLTS EQUALLY IN SMALL INCREMENTS TO PULL THE COVER INTO POSITION EQUALLY. MONITOR THE ENGAGEMENT OF THE COVER TO MAKE SURE THAT THE PACKING IS NOT CUT DURING INSTALLATION. A CUT PACKING WILL CAUSE SUBSEQUENT OIL LOSS AND CAN CAUSE AN IN-FLIGHT SHUTDOWN.

5 If you do not find coke, close the No. 4 bearing compartment as follows.

a Apply Engine Oil P03-001 fully to the new packing (804/1).

b Install the new packing into the groove at the rear flange of the No. 4 bearing cover (804/2).

c Install the cover into the rear inner flange of the exhaust case.

d Install 4 work bolts equally spaced around the cover.

e Tighten the bolts equally in small increments to pull the cover into position equally.

f Monitor the engagement of the cover to make sure the packing is not cut.

g Remove the work bolts.

h Put the heat shield (804/5) in the recess in the shield (804/4).

i Lubricate the threads of 30 bolts (804/3) with Engine Oil P03−001.

j Attach the shield with the bolts. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(g) Examine the No. 3 bearing oil scavenge manifold assembly (LR04) for coke and other deterioration as follows. See Figure 805.

1 Remove the (LR04) manifold assembly as follows.

a Remove the lockwire. Disconnect the nut from the manifold elbow that is on the diffuser case.

b Remove the bolts that attach the manifold to the oil pump port.

c Remove the clamp bolt and nut that attach the manifold.

d Remove the manifold.

e Discard the packing.

2 Look for coke in the manifold and in the diffuser case internal tube.

3 If you find coke in the manifold, the No. 3 bearing carbon seals or oil nozzle are possibly damaged. Remove and repair the engine.

4 If you do not find coke in the manifold, install the (LR04) manifold as follows.

R a Lubricate with Antiseize Paste P06-054 the threads of the bolts that will go into the
R oil pump. Wipe off unwanted paste.

b Lubricate with Engine Oil P03-001:
- The threads of all other bolts
- A packing
- The threads of the manifold elbow

c Install the packing in the packing groove near the flange of the manifold.

d Install the manifold, at one end, to the tube nut of the diffuser case internal tube. Tighten the tube nut by hand.

e Attach the manifold, at the other end, to the oil pump port with bolts. Tighten the bolts by hand.

f Attach the (LR05) tube and (LR04) manifold to the oil pump bracket with clamps, a bolt, and a nut.

g (Post SB PW4ENG 79-46) Attach the (LR04) manifold to the (LR05) tube with the clamps, bolt, and nut. Be sure the (clip-on) loop clamp grommet halves are on the (LR04) manifold and the (LR05) tube at this clamping location.

h Torque the bolts/nuts to these torques:
- Clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m)
- Tube nut to 650 - 700 lb-in. (73.440 - 79.089 N.m)
- Other bolts to 62 - 72 lb-in. (7.005 - 8.135 N.m)

i Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 in the tube nut and the manifold/oil pump bolts.

(h) Examine the No. 3 bearing breather tube assemblies (LB03 and LB04) for coke. See Figure 806.

1 Remove the upper tube (LB03) as follows:

a Remove the lockwire from the upper and lower tube nuts of the upper tube.

b Disconnect the tube from the diffuser case internal tube nut at approximately 1 o'clock position.

c Disconnect the tube from the lower tube nut at approximately 10 o'clock position.

d Remove the clamp bolts and nuts that attach the tube to brackets.

e Remove the tube.

2 Remove the lower tube (LB04) as follows:

a Remove the three bolts that attach the tube to the gearbox deoiler.

b Remove the clamp bolt that attaches the tube to the bracket.

c Disengage the tube. Discard the packing.

3 Examine in the breather tubes and in the diffuser case internal tube for coke.

4 If you find coke, the No. 3 bearing carbon seals and/or oil nozzle are possibly damaged. Remove and repair the engine.

5 If you do not find coke in the tubes, install the lower tube (LB04) as follows:

a Lubricate with Engine Oil P03−001:
− The packing
− The threads of all the bolts

b Install a new packing in the groove at the flanged end of the tube.

c Attach the tube to the gearbox pad with three bolts. Tighten the bolts by hand.

d Attach the clamp to the bracket with one bolt.

e Torque the:
- Clamp bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m)
- Other bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m)

f Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the gearbox pad bolts.

6 If you do not find coke in the tubes, install the upper tube (LB03).

R a Lubricate with Antiseize Paste P06−054 and
R wipe off unwanted paste:
- The threads of the lower tube nut

b Lubricate with Engine Oil P03−001:
- The threads of the tube nut (internal tube of the diffuser case)

c Install the tube to the tube nuts. Tighten the tube nuts by hand.

d Attach the clamps to the brackets with bolts and nuts.

e Torque the:
- Clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m)
- Tube nut (internal tube of the diffuser case) to 650 − 700 lb−in. (73.440 − 79.089 N.m)
- Tube nut (lower) to 675 − 750 lb−in. (76.265 − 84.739 N.m)

f Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 in the tube nuts.

(i) If you found no coke:

1 Flush the oil system. Refer to Servicing-05 Task 72-00-00-610-004.

2 Do 71-00-00, Testing-12 Task 71-00-00-760-050.

3 Do 71-00-00, Testing-03 Task 71-00-00-760-030.

4 Examine the color, viscosity, and acidity of the oil after 50 hours of service. If any of these properties is not correct, remove the engine and do the "Inspections For Very High Temperature".

D. Inspections For Very High Temperature

(1) Disassemble the engine to get access to all the main and accessory drive bearings, seals, and nozzles.

(2) Examine all the main bearings, seals, seal seats, and nozzles.

(3) Examine all the accessory drive bearings, seals, seal seats, and nozzles.

(4) Repair or replace any damaged parts.

No. 3 Bearing Breather Tube Removal/Installation
Figure 806
(Task 72-00-00-280-053)

Task 72−00−00−280−054:

1. Examine The Oil System For Contamination

A. Equipment And Materials

Special Tools:

PWA 86018	Adapter, Oil Sampler

Consumable Materials:

Item No.	Designation
P11−027	Solvent Petroleum (PMC 9001)

B. Sources Of Contamination

(1) There are four primary sources of contamination of the oil system:

(a) Unwanted material that is in the engine from the time of its assembly (called build debris) and pieces of a repair.

1 This includes pieces of gasket or packing, sealing compound, pieces of metal, etc.

2 These pieces are frequently non−metallic.

3 If metallic, these pieces are frequently larger than the particles that come from a bearing or gear.

(b) Metal particles from a bearing or gear.

1 This contamination is important.

2 You must find the source of the contamination and correct the problem before the engine goes back in service.

(c) Hydraulic fluid (e.g. Skydrol).

CAUTION: HIGH TEMPERATURES CAN CAUSE OIL TO BECOME BLACK. IF HIGH TEMPERATURES ARE A POSSIBLE CAUSE OF BLACK OIL, REFER TO 71−00−00, FAULT ISOLATION−01 TASK 71−00−00−810−001.

1 This contamination is important.

2 Oil that has hydraulic fluid in it is black, thick, and gummy. This oil causes a blockage of jets, nozzles, and small−mesh screens.

3 Oil that has hydraulic fluid in it can cause damage to packings. The quantity of damage depends on the quantity, temperature, and length of time of contamination. If packings are damaged, leaks and corrosion of oil system parts is possible.

4 Hydraulic fluid can get into the oil system if:

a There was a failure of a hydraulic pump

b Someone put hydraulic fluid in the oil tank in error.

(d) Jet fuel.

1 This contamination is important.

2 If oil has fuel in it, you can smell the fuel. Also, the viscosity of oil that has fuel in it is less than for oil that does not have fuel contamination. Engine symptoms are high oil temperature and overservicing of (too much oil in) the oil tank.

3 Oil that has fuel in it causes damage to packings. Damaged packings cause oil leaks in the gearbox accessory seals. Depending on the quantity and length of time of the fuel contamination, damage to the bearings is possible.

4 It is possible that an internal leak in the fuel−oil cooler is the cause of fuel contamination.

C. Inspection For Contamination From Solids (Build Debris, Pieces From A Repair, Bearing, Or Gear)

(1) Do the inspections that follow.

(a) Do an inspection of the magnetic chip detector assemblies. Refer to 72-00-61, Inspection/Check-04 (Task 72-00-61-210-002).

NOTE: You must keep to a minimum the quantity of times that the main oil filter delta-P warning light comes on. Do the inspection/replacement of the main oil filter at the recommended times.

(b) If not done during the inspection of the magnetic chip detectors, examine the main oil filter for contamination as follows.

1 Remove the main oil filter. Refer to 72-00-61, Removal-35 (Task 72-00-61-030-001).

2 Flush the filter with Solvent P11-027.

3 Strain the solvent through filter paper or a clean cloth. Keep any contamination you find for analysis.

4 Identify the contamination. Refer to 72-00-61, Inspection/Check-04 Task 72-00-61-210-002.

5 Install a new main oil filter. Refer to 72-00-61, Installation-35 Task 72-00-61-430-001.

(c) Examine the last chance oil strainers for contamination.

1 Remove all the last chance oil strainers. Refer to Removal-01 Task 72-00-00-050-001, Removal-02 Task 72-00-00-050-002, Removal-03 Task 72-00-00-050-003, and Removal-04 Task 72-00-00-050-004.

2 Examine and clean the strainer elements. Refer to Cleaning-01 Task 72-00-00-110-001. Keep any contamination that you find for analysis.

3 Install the last chance oil strainers. Refer to Installation-01 Task 72-00-00-450-001, Installation-02 Task 72-00-00-450-002, Installation-03 Task 72-00-00-450-003, and Installation-04 Task 72-00-00-450-004.

(d) If there was no contamination, you can put the engine back in service.

(2) Identify the contamination. If necessary, Refer to 72-00-61, Inspection/Check-04 Task 72-00-61-210-002 for spectroscopic analysis.

(a) If the particles are from the bearings or gears, you must correct the problem before you can use the engine.

(b) If the particles/pieces are not from the bearings or gears (that is, if they are pieces from a repair, etc.), do as follows.

1 Flush the engine oil system. Refer to 72-00-00, Servicing-05 Task 72-00-00-610-004.

2 Operate the engine at idle until the temperature of the oil is more than 150°F (65.6°C). Refer to 71-00-00, Testing-00 (Task 71-00-00-990-003), "Engine Starting Procedures (Normal)".

3 Accelerate from idle to 1.35 - 1.40 EPR, then go back to idle. Do this five times.

4 Operate the engine at 1.35 - 1.40 EPR for 10 minutes.

5 Shut down the engine. Refer to 71-00-00, Maintenance Practices-01, "Engine Shutdown Procedure," (Normal).

6 Examine the main oil filter and magnetic chip detectors for contamination. Refer to Paragraphs C.(1)(a) and (b).

a If there is no contamination, continue to use the engine. Do a magnetic chip detector inspection at 50 hours of service. Refer to 72-00-61, Inspection/Check-04 (Task 72-00-61-210-002).

b If there is contamination, do the "Inspection For Contamination From Solids" again. If there is still contamination, remove the engine from service. You must find the source of the contamination and correct the problem before you put the engine back in service.

NOTE: It is not necessary to remove the last chance oil strainers.

D. Inspection For Black Oil

NOTE: Dark oil can be an indication of a serious problem or it can be a condition that requires no maintenance action. The dark oil condition "black oil" is the result of some additives in the oil that oxidize as the oil ages. This can cause very fine carbon particulate which darkens the oil without an effect on the properties which lubricate and cool (Total acid number and viscosity are not changed).

(1) If you see dark oil, you can determine if maintenance action is necessary with the steps that follow:

(a) Does the oil have an unusual smell (burnt or equivalent to fuel or hydraulic fluid)?

(b) Is the oil thick or gummy?

(c) Did an engine oil over temperature ever occur?

(2) If you answer "yes" to any of the above questions, you must do the procedures that follow:

(a) Do the inspection for contamination from hydraulic fluid.

(b) Perform Oil Overtemperature Inspection. See 72-00-00, Inspection/Check-03 Task 72-00-00-280-053.

(3) If you answer "no" to these questions, the engine can continue in service.

E. Inspection For Contamination From Hydraulic Fluid

ENGINE GENERAL − INSPECTION/CHECK−04

CAUTION: HIGH TEMPERATURES CAN CAUSE OIL TO BECOME BLACK. IF HIGH TEMPERATURES ARE A POSSIBLE CAUSE OF BLACK OIL, REFER TO 71−00−00, FAULT ISOLATION−01 TASK 71−00−00−810−001.

(1) Do an inspection for contamination from hydraulic fluid if one or more of the items that follows is true.

(a) There was failure of a hydraulic pump, and it is possible that hydraulic fluid went in the gearbox drain

(b) There is corrosion of metal adjacent to the gearbox in the cavity of the hydraulic pump drive pad

(c) There is hydraulic fluid in the cavity of the hydraulic pump drive pad

(d) The engine oil is black, thick, and gummy.

(2) The inspection for contamination from hydraulic fluid is as follows.

R (a) Examine the viscosity of the oil. Refer to SB
R 72−238 for oil quality limits.

1 Compare the oil that you think is dirty with oil of the same brand that you know is good.

2 A large difference in viscosity is an indication of contamination by either jet fuel or hydraulic fluid.

(b) Do a check of the phosphorus content of the oil. This is the best check of hydraulic fluid contamination. Use either the wet chemical test (ASTM D−1091−64) or spectroscopic oil analysis.

1 Compare the oil that you think is dirty with oil of the same brand that you know is good.

2 A large difference in the results of the test is an indication of contamination by hydraulic fluid.

(3) If the inspection of the oil shows that there is contamination from hydraulic fluid or if you think a hydraulic pump is damaged, repair the damaged engine parts as follows.

(a) Remove the hydraulic pump(s) that failed. Refer to 71-00-61, Installation-16 Task 71-00-61-050-012 or Installation-17 Task 71-00-61-050-013, as applicable.

(b) Remove the fluid from the cavity in the drive pad.

(c) Remove the carbon seal from the hydraulic pump drive pad. Refer to 72-00-61, Removal-16 Task 72-00-61-030-007 or 72-00-61, Removal-17 Task 72-00-61-030-008, as applicable.

1 Examine the seal and the packing for deterioration. Replace them if necessary.

2 Examine the driveshaft bearing support and bearings.

a Try to move the driveshaft axially and radially.

b If the driveshaft is loose, remove the bearing. Examine the bearing for damage. If damaged, you must replace the bearing.

(d) Install or, if damaged, replace the carbon seal. Refer to 72-00-61, Installation-16 Task 72-00-61-430-007 or Installation-17 Task 72-00-61-430-008.

(e) Install or, if damaged, replace the hydraulic pump(s). Refer to 71-00-61, Installation-12 Task 71-00-61-450-012 or 71-00-61, Installation-13 Task 71-00-61-450-013.

(f) Do the "Procedure To Put The Oil System Back To A Serviceable Condition".

F. Inspection For Contamination From Jet Fuel

(1) When to do an inspection for contamination from jet fuel:

(a) If you smell jet fuel in the oil.

(b) If there was overservicing of (too much oil in) the oil tank.

(c) If there is an indication of high oil temperature.

(2) The inspection for contamination from jet fuel is as follows.

R (a) Examine the viscosity of the oil. Refer to SB 72-238 for oil quality limits.

1 Compare the oil that you think is dirty with oil of the same brand that you know is good.

2 A large difference in viscosity is an indication of contamination by either jet fuel or hydraulic fluid.

(b) Do a check of the phosphorus content of the oil to know if the contamination is from hydraulic fluid or jet fuel. Use either the wet chemical test (ASTM D-1091-64) or spectroscopic oil analysis.

1 Compare the oil that you think is dirty with oil of the same brand that you know is good.

2 A large difference in the results of the tests is an indication of contamination by hydraulic fluid, not jet fuel.

(3) If there is jet fuel contamination, do as follows.

(a) Remove the fuel/oil cooler. Refer to 72-00-35, Removal-04 Task 72-00-35-050-001-A00 or Task 72-00-35-050-001-B00.

(b) Do an inspection of the fuel/oil cooler. Refer to the CMM, 79-21-15. Repair or replace the component as necessary.

(c) Do the "Procedure To Put The Oil System Back To A Serviceable Condition".

G. Procedure To Put The Oil System Back To A Serviceable Condition

(1) Flush the engine oil system. Refer to Servicing-05 Task 72-00-00-610-004.

(2) Start the engine. Refer to 71-00-00, Testing-00 (Task 71-00-00-990-003), "Engine Starting Procedures (Normal)".

(3) Operate the engine at idle until the temperature of the oil is more than 150°F (65.6°C).

(4) Accelerate from idle to 1.35 - 1.40 EPR and go back to idle, five times.

(5) Operate the engine at 1.35 - 1.40 EPR for 10 minutes.

(6) Shut down the engine. Refer to 71-00-00, Testing-00 (Task 71-00-00-990-003), "Engine Shutdown Procedure," (Normal).

(7) Get a sample of oil as follows.

  (a) Remove the magnetic probe from the chip detector assembly that is in the oil tank. Refer to 72-00-61, Removal-36 (Task 72-00-61-050-017).

  (b) Install PWA 86018 Adapter in the valve of the magnetic chip detector assembly.

  (c) Get a sample of oil.

  (d) Make an analysis of the oil. Refer to Paragraph E. (2) or F.(2).

  (e) You can use the engine while you make the analysis for contamination.

  (f) If the sample of oil shows contamination, do Paragraphs E. or F. and G. again.

ENGINE GENERAL - INSPECTION/CHECK-05

Task 72-00-00-210-002:

1. Inspect Engine Fuel And Control System
   A. Equipment And Materials Required - None
   B. Procedure
      See Table 801.
      (1) Inspection Reference Table is intended to serve as an aid for identifying certain areas and conditions whenever disassembly time permits inspection. Disassembly inspection should not be accomplished solely on basis of these tables. Tables should be used when disassembly is required as a result of other maintenance actions.
      (2) Table 801 does not imply that items or conditions listed are all-inclusive. Experience and judgement will continue to be an important part of any inspection program.

Table 801 - Inspection Reference Table.

ITEM	INSPECT FOR	COMPONENT MAINTENANCE MANUAL CHAPTER/ SECTION REFERENCE
Fuel Pump	External Leakage	73-11-04
	Security of mounting.	
Fuel Pump Filter	Contamination of paper (cartridge) filter element.	73-11-04
	NOTE: Pump filter element must be checked frequently in new aircraft and after rework of fuel tanks.	
Fuel Distribution Valve	External fuel leakage.	73-11-08
	Security of mounting.	
Fuel Distribution Valve Strainer	Inlet screen contamination and damage.	73-11-08

ENGINE GENERAL - INSPECTION/CHECK-05

ITEM	INSPECT FOR	COMPONENT MAINTENANCE MANUAL CHAPTER/ SECTION REFERENCE
Fuel Metering Unit	External fuel leakage.	73-21-38
	Security of fuel metering unit to pump.	
	Security of electrical connectors.	
EEC Inlet Pressure/ Temperature (PT2/TT2) Probe	Security of electrical connector.	73-21-33
	Security of mounting.	

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72−00−00−790−001:

1. Leak Check Fuel Distribution System

A. Equipment And Materials Required

Special Tools:

PWA 85579	Adapter
PWA 86459	Puller, Strainer

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Material:

	Item No.	Designation
	P03−001	Oil, Engine (PWA 521B)
	P05−007	Fluid, Leak Check (PMC 9569 or PMC 2277)
	P05−289	Lockwire (AS3214−02)
	P05−291	Cable, Safety (Optional)
	P05−292	Ferrule, Safety Cable (Optional)
R	P06−053	Lubricant, Sealing Ring (PWA 36500)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	2	73−13−00/4/70
Packing	1	73−13−00/5/10
Packing	1	73−13−00/5/30

B. Procedure

See Figure 801.

NOTE: Minimum clearance between any two adjacent tubes or between one single tube and any other adjacent engine part shall be 0.125 inch (3.175 mm) unless otherwise specified. Exceptions to this clearance requirement are permitted at specific locations where adjacent tubes are clipped together or where other local constraints will prevent tube contact at clearances below 0.125 inch (3.175 mm) minimum.

NOTE: Minimum clearance refers only to clearance relative to tube and not to fittings or other attached hardware.

(1) Remove the bolts that secure the front rear flanges of the fuel flowmeter support and the bracket (Pre SB PW4ENG 73-163 only) to the fuel flowmeter and to the fuel distribution valve. Remove the fuel flowmeter support and the bracket from the engine.

(2) Translate packing transfer tube assembly rearward into fuel distribution valve cover.

(3) Remove bolts securing strainer housing cover to distribution valve and remove cover and tube from valve. Remove tube from cover. Discard packings from tube and cover.

CAUTION: USE THE PWA 86459 PULLER TO AVOID DAMAGE TO THE STRAINER.

(4) Engage the PWA 86459 Puller to the strainer and pull the strainer from the housing. Disengage the puller from the strainer and remove the puller and strainer from the engine separately. Discard the packing.

(5) Inspect fuel distribution valve strainer per 72-00-41, Inspection/Check-05.

(6) Clean fuel distribution valve strainer per 72-00-41, Cleaning-03 or -04.

R (7) Install a packing, lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 to the groove on end of the strainer and install the strainer into the fuel distribution valve housing.

(8) Install PWA 85579 Adapter to four hole pad on valve aligning offset bolt hole and secure with detail bolts.

(9) Using available air supply through above adapter pressurize fuel manifold and distribution valve to 95 - 105 psig (655.0 - 723.9 kPa) with air and check for leaks by applying Leak Check Fluid P05-007, for five (5) minutes. There shall be no visible leakage from any surface, joint or connection.

(10) If any leakage is present, replace and/or repair as required and repeat Step (9) as required.

(11) If for any reason any portion of subject system has been removed or replaced at assembly, repeat Step (9) as required.

(12) Disconnect air supply and remove adapter from fuel distribution valve. Store bolts in threaded holes in adapter.

R (13) Install the two packings, lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 to the grooves in packing transfer tube assembly. Install the transfer tube into distribution valve cover.

R (14) Install a packing, lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 to the cover and install the cover (with tube) to the fuel distribution valve housing. Secure strainer cover with washers and bolts, threads lubricated with Engine Oil P03-001. Torque bolts to 30 - 33 lb-in. (762.00 - 838.20 N.m).

(15) Translate transfer tube forward with dowel pin and boltholes aligned.

NOTE: Ensure sealplate is installed against rear flange of fuel flowmeter and dowel pin is aligned.

(16) Install fuel flowmeter support over transfer tube aligning dowel pin on transfer tube with slot in support and aligning boltholes in rear (larger) flange. Install bracket over support and position as shown in Figure 801.

(17) Secure rear flange with bolts (without drilled heads) lubricated with Engine Oil P03-001. Secure front flange with drilled head bolts lubricated with Engine Oil P03-001.

(18) Torque all bolts at front and rear flanges to 85 - 95 lb-in. (9.604 - 10.734 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 the bolts on the front flange.

C. Postrequisites

ENGINE GENERAL - INSPECTION/CHECK-07

Task 72-00-00-210-015:

1. Engine Windmilling Inspection

This Procedure Has Been Deleted

Task 72-00-00-210-016:

1. Procedures Following Ingestion Of High Concentration Of Volcanic Ash Or Sand

A. Equipment And Materials Required

Special Tools:

PWA 86018	Adapter, Oil Sampler

B. Procedure

CAUTION: INGESTION OF HIGH CONCENTRATION OF VOLCANIC ASH OR SAND INTO AN ENGINE CAN CAUSE OPERATIONAL PROBLEMS INCLUDING LOSS OF POWER. EVEN IF OPERATIONAL PROBLEMS ARE NOT EXPERIENCED, ASH OR SAND CONTAMINATION OF ENGINE SYSTEMS COULD RESULT IN PROBLEMS SUCH AS PERFORMANCE DETERIORATION, BLOCKED COOLING AIR PASSAGES AND ABRASIVE DAMAGE. IF ENGINES HAVE BEEN SUBJECTED TO VOLCANIC ASH OR SAND INGESTION, THE FOLLOWING PROCEDURE SHOULD BE COMPLIED WITH:

(1) If engines have experienced operational problems resulting from ash or sand ingestion:

(a) Remove engine(s), disassemble, inspect and repair as necessary, paying particular attention to oil system, air supplied components, turbine cooling passages and fuel system components.

(2) If engines have not experienced operational problems resulting from ash or sand ingestion:

(a) Visually inspect engine inlet and exhaust areas for evidence of damage or excessive erosion. Refer to 72-00-00, Inspection/Check-12 Task 72-00-00-210-010.

(b) Borescope inspect high pressure compressor and high pressure turbine for evidence of following:

1 Excessive erosion

2 Foreign object damage (FOD)

3 Blockage of high pressure turbine airfoil cooling holes

4 Build-up of ash deposits

NOTE: For borescope inspection procedures refer to 72-00-00, Inspection/Check-01A (Task 72-00-00-990-010) and inspection limits refer to 72-00-00, Inspection/Check-01C (Task 72-00-00-210-004), 72-00-00, Inspection/Check-01E (Task 72-00-00-210-017), 72-00-00, Inspection/Check-01F (Task 72-00-00-210-005) and 72-00-00, Inspection/Check-01G (Task 72-00-00-210-006).

(c) Do an inspection of the magnetic chip detector and the oil, as follows.

1 Examine the magnetic plugs for contamination. Refer to 72-00-61, Inspection/Check-04 (Task 72-00-61-210-002).

2 Do a spectroscopic analysis of the oil, as follows.

a With the magnetic chip detector removed from the oil tank, install PWA 86018 Adapter at that location. Get a sample of oil.

b Do a spectroscopic analysis of the oil to know if there is engine damage. Refer to 72-00-61, Inspection/Check-04 (Task 72-00-61-210-002).

3 If the oil is not satisfactory, flush the oil system. Refer to Servicing-05 (Task 72-00-00-610-004). Then make another analysis of the oil.

(d) Install the magnetic chip detector assemblies. Refer to 72-00-61, Installation-36 (Task 72-00-61-450-017).

(e) Remove, clean, and replace oil, fuel, and air filters. If contamination is found, retain sample for analysis. See following substeps for specific items to be checked.

1 Oil System

- a Main oil filter. See 72-00-61, Removal-35 Task 72-00-61-030-001 and Installation-35 Task 72-00-61-430-001.

- b No. 1, 1.5 and 2 bearing oil pressure strainer (last chance). See 72-00-00, Removal-01 Task 72-00-00-050-001 and Installation-01 Task 72-00-00-450-001.

- c No. 3 bearing oil pressure strainer (last chance). See 72-00-00, Removal-03 Task 72-00-00-050-003 and Installation-03 Task 72-00-00-450-003.

- d No. 4 bearing oil pressure strainer (last chance). See 72-00-00, Removal-04 Task 72-00-00-050-004 and Installation-04 Task 72-00-00-450-004.

- e Angle and main gearbox strainer (last chance). See 72-00-00, Removal-02 Task 72-00-00-050-002 and Installation-02 Task 72-00-00-450-002.

2 Fuel System

- a Fuel pump filter. See 72-00-61, Removal-24 Task 72-00-61-060-001 and Installation-24 Task 72-00-61-460-001.

  NOTE: If fuel filter bypass light indication was noted during last operation or during exposure to high concentrations of sand or volcanic ash contaminants the following additional fuel filters should be checked.

- b Fuel distribution valve inlet screen. See 72-00-41, Removal-10 Task 72-00-41-060-001 and Installation-10 Task 72-00-41-460-001.

3 Air System

- a HPC bleed air filters. See 72-00-35, Removal-15 Task 72-00-35-050-012 and Installation-15 Task 72-00-35-450-012.

(f) Ground run engine to determine if a shift in performance parameters has occurred. If parameters are abnormal, engine should be replaced. See 71-00-00, Testing-09 Task 71-00-00-760-020.

Previous Pageblock Return to Previous Menu Next Pageblock

ENGINE GENERAL - INSPECTION/CHECK-09

Task 72-00-00-210-018:

1. Use Of Damaged Engines And Parts

   A. Equipment And Materials Required - None

   B. Procedure

      (1) Engines and engine parts involved in abnormal operational circumstances require special disposition before a determination can be made as to their continued serviceability.

      (2) Abnormal operational circumstances are defined as events which fall outside the operating envelope for the engine, aircraft, or engine/aircraft combination as originally certified. These circumstances include such events as:

         (a) Accidents

         (b) Serious Operational Events

         (c) Impacted/Dropped Engines

         (d) Tailpipe Fires

      (3) See Standard Practices Manual, Chapter/Section 70-00-00, for detailed instructions regarding disposition of engines and parts involved in abnormal operational circumstances.

         NOTE: HPC rear drum OD thrust balance knife-edge seal must be inspected per Inspection/Check-04 (Task 72-00-35-210-004) in the event of turbine rotating part fractures accompanied by high vibration. See Figure 801.

ENGINE GENERAL - INSPECTION/CHECK-10

Task 72-00-00-210-022:

1. Engine Inspection Following Overtemperature

A. General

(1) Use this inspection procedure to examine the engine after exhaust gas (EGT) overtemperature operation.

(2) An EGT overtemperature condition occurs when the engine is operated for more than the exhaust gas temperature (EGT) limits. The EGT limits are shown in Chapter 71-00-00 Power Plant General - Testing-00, Engine Operation Limits Task 71-00-00-990-007.

(3) To tell which inspections from this procedure are necessary after EGT overtemperature, obey the instructions shown in Figure 1306 of 71-00-00 Power Plant General - Testing-00, Engine Operation Limits Task 71-00-00-990-007.

B. Equipment And Tools Necessary - None

C. Visual Inspection

(1) Visually check exhaust duct, plug and rear of front compressor drive turbine for burning, distortion, metal particles, or evidence of upstream blade and/or vane distress. If acceptable, continue-in-service after cause of overtemperature has been found and corrected.

D. Hot Section Inspection

(1) Igniter Plug High Tension Leads

(a) If engine was rapidly shut down per the emergency shutdown procedure, the high tension leads must be inspected, particularly at igniter plug terminal, to assure that excessive temperatures did not affect lead insulator.

NOTE: Heat dissipation through igniter plug and high tension lead, caused by a lack of sufficient cooling air during rapid shutdown, can cause deterioration of rubber insulation and result in arcing at terminal area.

(2) Combustion Chamber Area

(a) Using a rigid or flexible borescope, check for signs of cracks, burning, overheating, erosion, distortion, combustion liner shift (movement), pin wear, wear at nozzle and mounts. See 72-00-00, Inspection/Check-01D Task 72-00-00-210-020.

(3) Check fuel injectors, using same borescope holes as in step B.(2).

(a) Check for carbon deposits, cracks, distortion, wear, rupture, and burn through. See 72-00-00, Inspection/Check-01D Task 72-00-00-210-020.

(4) Check Stage 1 HPT vanes, using same borescope holes as in step B.(2).

(a) Check for cracks, FOD, erosion, corrosion, burning excessive bow. See 72-00-00, Inspection/Check-01E Task 72-00-00-210-017.

(5) Check Stage 1 HPT blades.

(a) Check for cracks, FOD, tip rub, erosion, corrosion. Discoloration in form of bullseye on airfoil. See 72-00-00, Inspection/Check-01F Task 72-00-00-210-005.

(6) Borescope Stage 2 HPT blades.

(a) Examine each blade individually for cracks or evidence of obvious growth such as localized thinning of airfoil in mid-span region, tip rub, erosion and FOD. See 72-00-00, Inspection/Check-01G Task 72-00-00-210-006.

(7) Borescope Stage 3 LPT vanes and blades.

(a) Check for cracks, FOD, tip rub and erosion. See 72-00-00, Inspection/Check-01H Task 72-00-00-210-007 and Inspection/Check-01I Task 72-00-00-210-025.

(b) If there has been a sudden increase in EGT, check for a possible missing or liberated LPT 3rd stage outer transition duct segment. No missing or liberated outer transition duct segments are permitted.

E. Engine Removal/Repair Following Overtemperature Condition

ENGINE GENERAL − INSPECTION/CHECK−10

(1) When engine has been subjected to overtemperature condition which necessitates engine removal or repair, tag the engine or the build group being replaced indicating maximum temperature reached, duration, whether overtemperature occurred under steady state or surge conditions, and other pertinent information.

(2) Referring to the applicable sections in the PW4000 Series CIR, PN 51A357 engine manual, make a hot section inspection. Accomplish repair as required to restore engine to serviceable condition. This should include removal and disassembly of the high pressure turbine rotors. Do a metallurgical analysis on one Stage 1 HPT blade assembly by the procedure shown in PW4000 Series CIR, PN 51A357 Chapter/Section 72−52−07 Inspection/Check−05 − Functional Check Blade Overtemperature Inspection − Stage 1 HPT Blade Assembly Task 72−52−07−200−006. This task will give a metallurgical analysis procedure with temperature limits for the Stage 1 HPT blade. It will also provide additional inspection requirements for other parts if the stage 1 HPT blade is over the temperature limits.

(3) Disassembly of Diffuser and Combustor Group and Low Pressure Turbine Assembly is not necessary unless distress is evident or suspected. However, visual and borescope inspections should be performed in these areas and in high and low pressure compressor groups to ensure entire engine gaspath is free of damage.

Previous Pageblock Return to Previous Menu Next Pageblock

ENGINE GENERAL - INSPECTION/CHECK-11

Task 72-00-00-210-023:

1. Engine Inspection Following Overspeed

See Figure 801.

A. No maintenance action is required if N1 is operating below:

4012 rpm (111.4% N1) - PW4152, PW4156, PW4156A and PW4158 Engines and............................if N2 is operating below:

10300 rpm (104% N2) - PW4152 Engine
10450 rpm (105.5% N2) - PW4156, PW4156A and PW4158 Engines

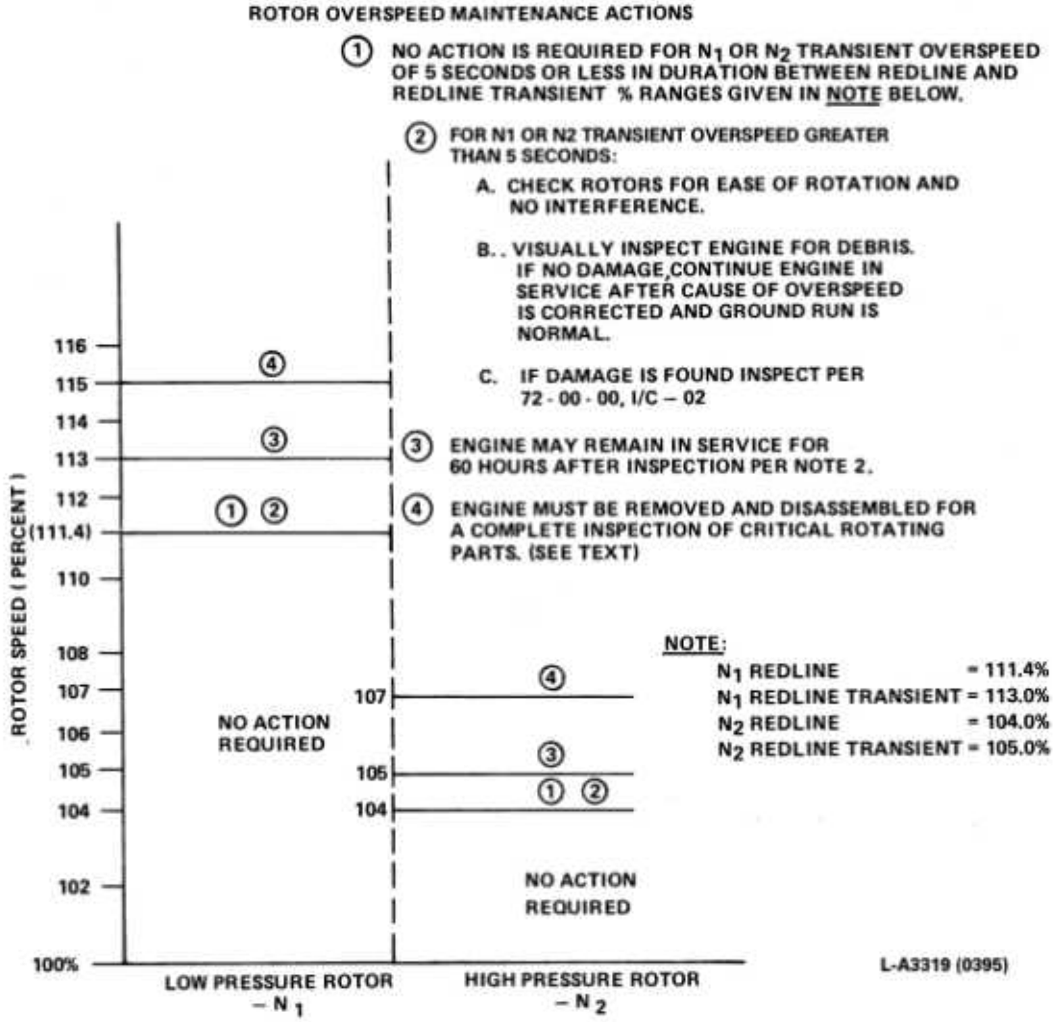
B. If N1 speed exceeds 4012 rpm (111.4 percent N1) but does not exceed 4070 rpm (113 percent N1) perform following inspection procedure.
  (1) Visually inspect inlet and exhaust duct for debris.
  (2) Check rotors for freedom of rotation.
  (3) Check engine speed indicating system for faults.
    (a) If inspection does not reveal any damage, continue engine in service after cause of overspeed is corrected and test run indicates normal operation.
    (b) If damage is evident, further inspection should be performed including gaspath borescope inspection as required and appropriate corrective action taken. See 72-00-00, Inspection/Check-01 (Task 72-00-00-990-009).

C. If N1 speed exceeds 4070 rpm (113 percent N1) but does not exceed 4140 rpm (115 percent N1) perform following inspection procedure.
  (1) Perform inspection procedures specified in Paragraph B.
  (2) Engine may remain in service for 60 hours after performing inspection specified above.

D. If N1 speed exceeds 4140 rpm (115 percent N1), engine must be shut down as soon as possible and inspected per following:

NOTE: Before removing an engine because of an overspeed indication, correct operation of the N1 speed indicating system should be verified.

  (1) Remove front compressor and fan and perform a complete overhaul inspection of rotating parts.
  (2) Inspect low pressure turbine blades for growth and for worn knife-edge seals.
  (3) Inspect low pressure turbine disks for growth.
  (4) Inspect front compressor drive turbine shaft for growth.
  (5) Inspect low pressure turbine disks and blades by fluorescent penetrant method.



ROTOR OVERSPEED MAINTENANCE ACTIONS

① NO ACTION IS REQUIRED FOR N_1 OR N_2 TRANSIENT OVERSPEED OF 5 SECONDS OR LESS IN DURATION BETWEEN REDLINE AND REDLINE TRANSIENT % RANGES GIVEN IN NOTE BELOW.

② FOR N1 OR N2 TRANSIENT OVERSPEED GREATER THAN 5 SECONDS:

A. CHECK ROTORS FOR EASE OF ROTATION AND NO INTERFERENCE.

B. . VISUALLY INSPECT ENGINE FOR DEBRIS. IF NO DAMAGE,CONTINUE ENGINE IN SERVICE AFTER CAUSE OF OVERSPEED IS CORRECTED AND GROUND RUN IS NORMAL.

C. IF DAMAGE IS FOUND INSPECT PER 72 - 00 - 00, I/C - 02

③ ENGINE MAY REMAIN IN SERVICE FOR 60 HOURS AFTER INSPECTION PER NOTE 2.

④ ENGINE MUST BE REMOVED AND DISASSEMBLED FOR A COMPLETE INSPECTION OF CRITICAL ROTATING PARTS. (SEE TEXT)

NOTE:

N_1 REDLINE = 111.4%
N_1 REDLINE TRANSIENT = 113.0%

E. If N2 speed exceeds:

10300 rpm (104% N2) − PW4152 Engine
10450 rpm (105.5% N2) − PW4156, PW4156A and PW4158 Engines

but does not exceed.......

10400 rpm (105% N2) − PW4152 Engine
10525 rpm (106.3% N2) − PW4156, PW4156A and PW4158 Engines

(1) No action is required for a transient overspeed of five seconds or less in duration.
(2) Perform following inspection procedure if step (1) is exceeded.
  (a) Visually inspect inlet and exhaust duct for debris.
  (b) Check rotors for freedom of rotation.
  (c) Check engine speed indicating system for faults.
    1 If inspection does not reveal any damage, continue engine in service after cause of overspeed is corrected and test run indicates normal operation.
    2 If damage is evident, further inspection should be performed including gaspath borescope inspection as required and appropriate corrective action taken. See 72−00−00, Inspection/Check−02.

F. If N2 speed exceeds:

10400 rpm (105% N2) − PW4152 Engine
10525 rpm (106.3% N2) − PW4156, PW4156A and PW4158 Engines

but does not exceed.......

10600 rpm (107% N2) − PW4152, PW4156, PW4156A and PW4158 Engines

(1) Perform inspection procedures specified in Paragraph E.(2).
(2) Engine may remain in service for 60 hours after performing inspection specified above.

G. If N2 speed exceeds 10600 rpm (107 percent N2). Engine must be shut down as soon as possible and inspected per the following. (PW4152, PW4156, PW4156A and PW4158 Engines)

NOTE: Before removing an engine because of an overspeed indication, correct operation of the N2 speed indicating system should be verified.

ENGINE GENERAL − INSPECTION/CHECK−11

(1) Remove rear compressor and perform a complete overhaul inspection.
(2) Inspect high pressure turbine blades for growth and for worn knife−edge seals.
(3) Inspect high pressure turbine disks for growth.
(4) Inspect high pressure turbine disks and blades by fluorescent penetrant method.

ENGINE GENERAL − INSPECTION/CHECK−12

Task 72−00−00−210−010:

1. Examine The Inlet, Exhaust Areas, And Externals
    - A. Equipment And Materials Required − None
    - B. Procedure
        - (1) Examine the inlet areas of the engine. Refer to Figure 801 and Table 801.

Inspection Of The Exhaust Area
Table 803

(a) Also, examine the tail cone area of the turbine exhaust case for metal particles. If there is a large quantity of metal particles, examine the engine with a borescope. Refer to Inspection/ Check-01 (Task 72-00-00-990-009).

CAUTION: A VERY CAREFUL INSPECTION OF THE TURBINE COOLING AIR TUBES (804/1 AND 804/4) IS VERY IMPORTANT. CRACKED OR BROKEN TURBINE COOLING AIR (TCA) TUBES CAN DAMAGE THE HIGH PRESSURE TURBINE.

A VERY CAREFUL INSPECTION OF THE LPT TCC SYSTEM MANIFOLDS (804/3) VALVES (804/5) AND CABLE (804/2) IS VERY IMPORTANT. A DEFECTIVE TURBINE CASE COOLING (TCC) SYSTEM CAN STRUCTURALLY DAMAGE THE LOW PRESSURE TURBINE (LPT).

(4) Examine the externals. See Figure 804 and Table 804.

ENGINE GENERAL - INSPECTION/CHECK-13

Task 72-00-00-210-026:

1. Engine Inspection Following Birdstrike With Rear Compressor Damage Beyond Acceptable Limits
   A. Equipment And Materials Required - None
   B. Procedure
      (1) Complete engine and rear compressor section disassembly must be accomplished to remove affected stages. See 72-00-35, Removal-01 or 72-00-35, Removal-02. Disassemble the rear compressor per 72-35-00, Disassembly-03, to remove the axial compressor rotor assembly. Disassemble the axial compressor rotor assembly per 72-35-01, Disassembly-01 and 72-35-38, Disassembly-01 to remove the affected stages.
      (2) Carefully inspect the Stage 5, 6, and 7 HPC blades paying particular attention to the blade tips for tip cracks. See 72-35-11, Inspection/Check-02, 72-35-12, Inspection/Check-02 and 72-35-13, Inspection/Check-02.

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72-00-00-210-027:

1. Examine The Variable Stator Vane Control System Rigging

A. General

WARNING: DO NOT PUT YOUR FINGERS IN THE WAY OF THE LINKAGES, UNISON RINGS, OR LEVERS WHEN YOU OPERATE THE STATOR VANE SYSTEM.

CAUTION: IT IS VERY IMPORTANT TO DO THIS MECHANICAL RIGGING CHECK WITH PRECISION. BAD RIGGING CAN CAUSE INCREASED HPC BLADE FATIGUE, INTERNAL ENGINE DAMAGE, OR COMPLETE ENGINE FAILURE.

ALWAYS REMOVE ALL RIG CHECK PINS BEFORE YOU MOVE THE STATOR VANE SYSTEM.

NOTE: Use this check procedure only:
-for a fast check of the compressor stator vane control system
-with the undersize Rig Check Pins.
Use the rig procedure in Special Procedure-05:
-if you find unsatisfactory rigging during the check and/or
-if you replace parts of the system.

B. Equipment And Materials Required

Special Tools:
PWA 86331 Rig Check Pin (3 Required)
PWA 86332 Rig Check Pin
PWA 86333 Rig Check Pin (Pre SB PW4ENG 72-246)
PWA 86334 Rig Check Pin (Post SB PW4ENG 72-246)
PWA 86344 Holder, Rigging

NOTE: The PWA 86335 Rigging Check Pin Kit contains the above undersize rig pins for only a check of the system. Do not rig the system with these pins.

The rig check pins used in this check procedure have a smaller diameter than the rig pins used in the rigging adjustment (ref. Special Procedure-05). This will permit a satisfactory check on systems with some wear from engine operation.

C. Procedure

See Figures 801 and 802.

CAUTION: BE SURE AND USE THE CORRECT BELLCRANK RIG CHECK PIN. USE THE LARGER PWA 86333 RIG CHECK PIN FOR (PRE SB PW4ENG 72−246 ENGINES). USE THE SMALLER PWA 86334 RIG CHECK PIN FOR (POST SB PW4ENG 72−246 ENGINES).

BE SURE THAT THE END OF THE RIG PINS ARE PROPERLY AND FULLY INSTALLED.

BE SURE YOU KEEP THE ACTUATOR ROD FULLY EXTENDED WHEN YOU INSTALL THE BELLCRANK RIG CHECK PIN. IF YOU LET THE ACTUATOR ROD RETRACT, THIS CHECK WILL NOT BE ACCURATE. THIS CAN RESULT IN HARMFUL STABILITY AND/OR DURABILITY EFFECTS.

TOO MUCH TORQUE WITH THE WRENCH ON THE BELLCRANK DURING THIS CHECK CAN BEND THE BELLCRANK BRACKET. THIS CAN RESULT IN BAD RIGGING.

(1) Use a standard crowsfoot and wrench on the flats of the bellcrank adjacent to the 5th stage adjuster. Pull down on the wrench and hold the bellcrank (801/3) so that the actuator rod is fully extended against the internal stop (vanes open). Hold the actuator fully extended against the internal stop with 300 − 400 lb−in. (33.895 − 45.194 N.m) on the crowsfoot. While you hold the actuator fully extended against the internal stop, install the PWA 86344 Holder between the jamnut and the top of the actuator housing. Tighten and torque the detail bolt to 8 − 10 lb−in. (0.904 − 1.130 N.m). Do not tighten the bolt too much. Tighten the detail jamnut by hand. Install the bellcrank PWA 86333 Rig Check Pin or the bellcrank PWA 86334 Rig Check Pin into the bellcrank arm slot (801/2) and into both holes of the support (801/1).

(2) If you can install the bellcrank rig check pin, remove the rig check pin. Remove the Holder (PWA 86344). Push up on the wrench and retract the actuator rod. Pull down again to fully extend the actuator rod again. Hold the actuator fully extended against the internal stop with 300 − 400 lb−in. (33.895 − 45.194 N.m) on the crowsfoot. While you hold the actuator fully extended against the internal stop, install the Holder (PWA 86344) between the jamnut and the top of the actuator housing. Tighten and torque the detail bolt to 8 − 10 lb−in. (0.904 − 1.130 N.m). Do not tighten the

bolt too much. Tighten the detail jamnut by hand. Install the bellcrank rig check pin again with the actuator rod fully extended. Go to step (4).

(3) If you can not install the bellcrank rig check pin, adjust the entire compressor stator vane control system per Special Procedure−05.

(4) With the actuator rod fully extended and the bellcrank rig check pin fully installed, install three PWA 86331 Rig Check Pins into the IGV, 5th, and 6th stage unison ring rig pin holes. Install the PWA 86332 Rig Check Pin into the 7th stage unison ring rig pin hole.

(5) If you can put all the rig check pins in, then remove all the check rig pins from the unison rings and the bellcrank. Remove the Holder (PWA 86344). The system is properly adjusted.

(6) If you can not put any one of the unison ring rig check pins in, adjust the entire compressor stator vane control system per Special Procedure−05.

CAUTION: BE SURE YOU REMOVE ALL OF THE RIG CHECK PINS AND THE HOLDER AFTER THE CHECK. DAMAGE TO THE COMPRESSOR STATOR VANE CONTROL SYSTEM CAN RESULT.

ENGINE GENERAL - INSPECTION/CHECK-15

Task 72-00-00-990-015:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are for the length of the designated tube or manifold.

(3) Numbers in all columns must be interpreted in inches and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned.

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B, or C located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.

IFR Code	Definition
(CONTINUED)	
C	Clearance or fit is not subject to change in normal engine operation.

C. Limits

(1) The minimum clearance between any two adjacent tubes or between one tube and any other adjacent engine part must be 0.125 inch (3.175 mm) unless otherwise specified.

(2) The exceptions to this clearance requirement are permitted at specific locations where adjacent tubes are clipped together or where other local constraints will prevent tube contact at clearances below the 0.125 inch (3.175 mm) minimum. Acceptable minimum clearances for those exceptions permitted are specified in the Fits And Clearances table.

NOTE: The minimum clearance refers only to the clearance relative to the tube and not the fittings or other attached hardware.

(3) Limits are applicable to any combination of new or used parts.

(a) The MIN column provides the acceptable minimum clearance in inches (and millimeters). This limit can be applied to any combination of new or used parts.

D. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permitted if the related Fit or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth or shrinkage.

E. Fits And Clearances

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
2301		Tube − PT 4.95 Bracket − Loop Clamp, Assembly (See Figure 801, Sheet 1)			0.040 (1.016)	
2302		Turbine Cooling Air Tube Assembly Total length of tube (See Figure 801 Sheet 2)			0.040 (1.016)	
2303		HPT Turbine Case Cooling Collector Total length of tube (See Figure 801, Sheet 1)			0.040 (1.016)	
2304		Manifold − Assembly, Cooling Turbine Case Total length of tube (See Figure 801, Sheet 2)			0.030 (0.762)	
2305		Manifold − Assembly, Cooling Turbine Case Total length of tube (See Figure 801, Sheet 2)			0.040 (1.016)	
2306		Manifold − Assembly, Cooling Turbine Case Total length of tube (See Figure 801, Sheet 2)			0.040 (1.016)	
2307		Manifold − Assembly, Cooling Turbine Case Total length of tube (See Figure 801, Sheet 2)			0.040 (1.016)

ENGINE GENERAL − REPAIR−01

Task 72−00−00−300−001:

1. Repair The Sealant Around The Bifurcation Fairing

This Repair Is Relocated To 72−00−33, Repair−01

Previous Pageblock Return to Previous Menu Next Pageblock

ENGINE GENERAL - REPAIR-02

Task 72-00-00-300-002:

1. In-situ HPC Blend Repair

A. Equipment And Materials Necessary - None

B. General

(1) This repair applies to all HPC blades part numbers on Stages 5 through 15 except as follows:

(a) It is not possible to In-situ blend the leading edge of Stages 10 and 12 HPC blades or the trailing edge of Stages 9, 11, and 15 due to tooling access.

(b) It is not possible to In-situ blend Stages 12 and 13 blades on engines that incorporate the HPC Ring Case Configuration, since you can not insert the blending tool through the AP-6 borescope port.

(2) This repair can be used to blend minor damage on the leading and/or trailing edges of the HPC blades in assembled engines. See 70-00-00, Inspection/Check-01C (Task 72-00-00-210-004) for repairable damage limits and blade locations that can be accessed, by stage.

(3) Authorization to perform this repair must be obtained in writing from Pratt & Whitney. Only sources that have demonstrated the capability of satisfying the technical requirements of this procedure can become qualified for this source demonstration repair. Sources interested in being considered for qualification should contact:

Pratt & Whitney
Manager, Repair Development Engineering
400 Main Street
MS 163-20
East Hartford, CT 06108

(FAX 860-565-9825)

ENGINE GENERAL − REPAIR−02

(4) Sources that are approved to do this repair are in the list that follows by source code number. Refer to the Standard Practices Manual, 70−40−00, General−01 in the Repair Vendors List for the company names and addresses identified by these numbers:

R C0040
C0098

(5) It is to be understood that Pratt & Whitney does not endorse the work performed by the company or companies named herein or any other company and does not accept responsibility to any degree for the selection of such company or companies for the performance of any work or procurement of supplies. The preceding does not apply to Pratt & Whitney Overhaul Center.

Task 72-00-00-610-001:

1. Drain Engine Oil System

A. Equipment And Materials Required

Special Tools:

PWA 86018	Adapter, Oil Sampler (Optional)

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
R	P06-054	Paste, Antiseize (PWA 36246)
	P11-004	Solvent, Cleaning (PMC 9010)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	72-62-00/3/190

B. Procedure
See Figure 1101.

NOTE: If you see "black oil" in the oil system, refer to the inspection for black oil, 72-00-00, Inspection/Check-04 Task 72-00-00-280-054. Black oil can be an indication of a serious problem or it can be a condition that requires no maintenance action.

WARNING: A MINIMUM OF FIVE MINUTES SHOULD ELAPSE AFTER ENGINE SHUTDOWN BEFORE REMOVING OIL TANK CAP OR DRAIN PLUGS TO ALLOW TANK PRESSURE TO BLEED OFF.

WARNING: USE CARE WHEN OPENING OIL TANK CAP OR REMOVING OIL TANK OR GEARBOX DRAIN PLUGS ON A RECENTLY RUN ENGINE. HOT OIL UNDER PRESSURE COULD BE RELEASED FROM TANK TO CAUSE SEVERE BURNS ON CONTACT WITH EYES OR SKIN.

(1) Loosen oil tank cap.

(2) Drain oil from oil tank and main gearbox by removing oil tank magnetic chip detector assembly and main gearbox magnetic chip detector assembly. See 72-00-61 Removal-36 (Task 72-00-61-050-017).

NOTE: You can use the PWA 86018 Adapter to drain the oil from the oil tank as an option to the magnetic chip detector removal.

(3) After removing the probes from the chip detector assemblies, clean the probes in Cleaning Solvent P11-004.

CAUTION: DO NOT MOTOR THE ENGINE WHEN YOU DRAIN THE ENGINE OIL. YOU CAN DAMAGE THE ENGINE IF YOU MOTOR THE ENGINE WITHOUT OIL IN THE SYSTEM.

(4) Drain oil from angle gearbox. See Figure 1102.

(a) Remove the fan exit liner segment from the 6 o'clock location. Refer to 72-00-33, Removal-16 Task 72-00-33-040-001.

(b) Remove bolts, washers, and plug on right side of angle gearbox bottom cover. Discard packing.

NOTE: Catch oil in container with a capacity of approximately 10 U.S. gallons (38 liters).

(5) Remove and discard main oil filter. See 72-00-61, Removal-35 (Task 72-00-61-030-001).

(6) Allow engine oil to slow drip from drains for approximately thirty (30) minutes.

(a) Lubricate a new packing with Engine Oil P03-001.

R (b) Apply Aniseize Paste P06-054 to the threads of two
R plug bolts. Wipe off unwanted paste.

(c) Install the packing on the plug.

(d) Install the plug in the cover.

(e) Attach the plug to the cover with two washers and the two bolts. Torque the bolts to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(7) Install the fan exit liner segment. Refer to 72-00-33, Installation-16 (Task 72-00-33-440-001).

C. Postrequisites

(1) Install the main oil filter. See 72-00-61, Installation-35 (Task 72-00-61-430-001).

(2) Install the oil tank and main gearbox magnetic chip detector assemblies. Refer to 72-00-61, Installation-36 (Task 72-00-61-450-017).

ENGINE GENERAL - SERVICING-02

Task 72-00-00-610-002:

1. Fill The Engine Oil System

A. Prerequisites

(1) Drain the engine oil system. See Servicing-01 Task 72-00-00-610-001.

(2) Remove the oil tank cap. Refer to 72-00-61, Removal-38 Task 72-00-61-040-002.

B. Equipment And Materials Required

Special Tools:

PWA 86018	Adapter, Oil Sampler (Optional)

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

C. Procedure
See Figure 1101.

CAUTION: MAKE SURE THAT THE MAGNETIC CHIP DETECTOR ASSEMBLIES ARE INSTALLED.

(1) (Post SB PW4ENG 79-18) Fill the oil system.

NOTE: The correct level of oil is at the bottom of the "V" made by the valve of the filler neck valve.

CAUTION: DO NOT USE THE PRESSURE FILL METHOD. THE MANUAL FILL METHOD ONLY IS PERMITTED.

(a) Put Engine Oil P03-001 in the filler neck valve until the level of oil reaches the bottom of the "V".

(b) Write down the quantity of oil added.

CAUTION: DO NOT USE THE OIL TANK SIGHT GAGE TO DO A CHECK OF THE OIL LEVEL. YOU MUST LOOK INSIDE THE OIL TANK TO CORRECTLY MEASURE THE OIL.

(2) (Pre SB PW4ENG 79-18 or Post SB PW4ENG 79-47) Fill the oil system.

NOTE: The correct oil level is at the top of the filler neck valve.

(a) Add Engine Oil P03-001 as necessary to reach the top of the filler neck valve.

(b) Write down the quantity of oil added.

(3) Install the oil tank cap. Refer to 72-00-61, Installation-38 Task 72-00-61-440-002.

(4) Dry motor the engine until the oil pressure is stable. Do the procedure in 71-00-00, Testing-02 Task 71-00-00-760-029.

(5) Examine the engine oil level between 15 minutes and 2 hours after shutdown of the engine.

CAUTION: DO NOT USE THE OIL TANK SIGHT GAGE TO DO A CHECK OF THE OIL LEVEL. YOU MUST LOOK INSIDE THE OIL TANK TO CORRECTLY MEASURE THE OIL.

(6) (Post SB PW4ENG 79-18) Do a check of the oil level.

(a) Remove the oil tank cap. Refer to 72-00-61, Removal-38 Task 72-00-61-040-002.

NOTE: The correct level of oil is at the bottom of the "V" made by the valve of the filler neck valve.

(b) If you DO NOT see oil (the oil is below the bottom of the "V"):

1 With a clean screwdriver, push open the valve of the filler neck.

2 With a strong light, look at the oil.

CAUTION: DO NOT USE THE PRESSURE FILL METHOD. THE MANUAL FILL METHOD ONLY IS PERMITTED.

3 Add Engine Oil P03-001 until the level of oil reaches the bottom of the "V".

4 Write down the quantity of oil added.

(c) If you DO see oil (the oil is above the bottom of the "V"):

1 Drain 10 quarts (9.46 l) of oil from the oil tank by removing and installing the oil tank magnetic chip detector assembly. See 72-00-61, Removal-36 (Task 72-00-61-050-017) and Installation-36 (Task 72-00-61-450-017).

NOTE: You can use the PWA 86018 Adapter to drain the oil from the oil tank as an option to the magnetic chip detector removal.

2 Install the oil tank cap. Refer to 72-00-61, Installation-38 (Task 72-00-61-440-002).

3 Dry motor the engine. Refer to 71-00-00, Testing-02 (Task 71-00-00-760-029).

4 Do another check of the oil level.

CAUTION: DO NOT USE THE OIL TANK SIGHT GAGE TO DO A CHECK OF THE OIL LEVEL. YOU MUST LOOK INSIDE THE OIL TANK TO CORRECTLY MEASURE THE OIL.

(7) (Pre SB PW4ENG 79-18 or Post SB PW4ENG 79-47) Do a check of the oil level. Examine the engine oil level between 15 minutes and 2 hours after shutdown of the engine.

(a) Remove the oil tank cap. Refer to 72-00-61, Removal-38 Task 72-00-61-040-002.

NOTE: The correct oil level is at the top of the filler neck valve.

CAUTION: DO NOT USE THE PRESSURE FILL METHOD. THE MANUAL FILL METHOD ONLY IS PERMITTED.

(b) Add Engine Oil P03-001 as necessary to reach the top of the filler neck valve.

(c) Write down the quantity of oil added.

D. Postrequisites

(1) Install the oil tank cap. Refer to 72-00-61, Installation-38 Task 72-00-61-440-002.

ENGINE GENERAL - SERVICING-03

Task 72-00-00-610-003:

1. Service The Engine Oil System

A. Equipment And Materials Required

Special Tools:

PWA 86018	Adapter, Oil Sampler (Optional)

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

B. When To Do A Check Of The Oil Level

CAUTION: YOU MUST EXAMINE THE OIL LEVEL BETWEEN 15 MINUTES AND 2 HOURS AFTER ENGINE SHUTDOWN. IF YOU DO NOT, THE OIL LEVEL SIGHTGLASS INDICATION WILL NOT BE ACCURATE.

(1) Examine the engine oil level between 15 minutes and 2 hours after shutdown of the engine.

(2) If engine shutdown occurred more than two hours before, you must dry motor the engine until the oil pressure is stable. Refer to 71-00-00, Testing-02 Task 71-00-00-760-029 for the dry motor procedure. The dry motor procedure returns to the oil tank any oil that drained from the oil tank. This makes it possible to know if the quantity of oil in the oil tank is correct.

C. Do A Check Of The Oil Level
See Figure 1101.

NOTE: If you see "black oil" in the oil system, refer to the inspection for black oil, 72-00-00, Inspection/Check-04 Task 72-00-00-280-054. Black oil can be an indication of a serious problem or it can be a condition that requires no maintenance action.

(1) Open the oil-fill access door.

WARNING: DO NOT OPEN THE OIL TANK CAP FOR FIVE MINUTES AFTER SHUTDOWN OF THE ENGINE. A MINIMUM OF FIVE MINUTES IS NECESSARY TO LET PRESSURE IN THE OIL TANK BLEED OFF.

WARNING: BE CAREFUL WHEN YOU OPEN THE OIL TANK CAP ON AN ENGINE THAT HAS JUST SHUT DOWN. HOT OIL THAT IS UNDER PRESSURE IS DANGEROUS. IT CAN BADLY BURN EYES AND SKIN.

(2) Remove the oil tank cap. Refer to 72-00-61, Removal-38 Task 72-00-61-040-002.

CAUTION: DO NOT USE THE OIL TANK SIGHT GAGE TO DO A CHECK OF THE OIL LEVEL. YOU MUST LOOK INSIDE THE OIL TANK TO CORRECTLY MEASURE THE OIL.

(3) (Post SB PW4ENG 79-18) Do a check of the oil level.

NOTE: The correct level of oil is at the bottom of the "V" made by the valve of the filler neck valve.

(a) If you DO NOT see oil (the oil is below the bottom of the "V"):

1 With a clean screwdriver, push open the valve of the filler neck.

2 With a strong light, look at the oil.

CAUTION: DO NOT USE THE PRESSURE FILL METHOD. THE MANUAL FILL METHOD ONLY IS PERMITTED.

3 Add Engine Oil P03-001 until the level of oil reaches the bottom of the "V".

4 Write down the quantity of oil added.

(b) If you DO see oil (the oil is above the bottom of the "V"):

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM AN ENGINE THAT HAS JUST SHUT DOWN. HOT OIL THAT IS UNDER PRESSURE IS DANGEROUS. IT CAN BADLY BURN EYES AND SKIN.

1 Drain 10 quarts (9.46 l) of oil from the oil tank by removing and installing the oil tank

magnetic chip detector assembly. See 72-00-61, Removal-36 (Task 72-00-61-050-017).

NOTE: You can use the PWA 86018 Adapter to drain the oil from the oil tank as an option to the magnetic chip detector removal.

2 Install the oil tank cap. Refer to 72-00-61, Installation-38 (Task 72-00-61-440-002).

3 Dry motor the engine. Refer to 71-00-00, Testing-02 (Task 71-00-00-760-029).

4 Do another check of the oil level.

CAUTION: DO NOT USE THE OIL TANK SIGHT GAGE TO DO A CHECK OF THE OIL LEVEL. YOU MUST LOOK INSIDE THE OIL TANK TO CORRECTLY MEASURE THE OIL.

(4) (Pre SB PW4ENG 79-18 or Post SB PW4ENG 79-47) Do a check of the oil level.

NOTE: The correct oil level is at the top of the filler neck valve.

(a) Add Engine Oil P03-001 as necessary to reach the top of the filler neck valve.

(b) Write down the quantity of oil added.

D. Postrequisites

(1) Install the oil tank cap. Refer to 72-00-61, Installation-38 Task 72-00-61-440-002.

(2) Close the oil-fill access door.

Figure 1101 (Sheet 2)
(Task 72-00-00-610-003)

Task 72-00-00-640-002:

1. Hot Oil Flush Procedure

A. Equipment And Materials Necessary

Special Tools:

CTE 9060	Hot Oil Cart
PWA 85525	Adapter
PWA 85526	Adapter
PWA 86018	Adapter, Oil Sampler (Optional)

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
	P05-292	Ferrule, Safety Cable (Optional)
R	P06-054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	2	79-21-00/7/1

B. Procedure

(1) If engine can be motored without further damage, hot oil flush operable and inoperable engines.

(a) Service cart, CTE 9060.

1 Drain any residual water or contaminants from reservoir, connecting lines and hydraulic system.

2 Close outlet valve from reservoir. Remove cap and connect oil supply to filling connection.

NOTE: Reservoir may be filled through inlet line if more convenient.

3 Open vent valve and inlet valve. Fill reservoir with approximately 50 gallons (189 l) of, jet engine oil or until overflow occurs from vent.

NOTE: Engine Oil P03−001 of same type and brand as used in engine must be used to service cart.

4 Close inlet valve and cap filling connection.

5 Set temperature controller in control cabinet at 300°F (149°C).

WARNING: CUT OFF POWER SUPPLY BEFORE CONNECTING OR DISCONNECTING LEADS TO CART OR BEFORE OPENING CONTROL CABINET.

(b) Perform following heating cycle.

1 Connect electrical leads to cart, to facility power supplies.

NOTE: When heating a charge in reservoir for recycling, initially set temperature controller at 225°F (107.2°C) and allow approximately one hour stabilizing period, or until evaporation of moisture through vent is complete, before heating to 300°F (149°C).

2 Energize cart electrical circuits sequentially.

a Power supply

b Circulating pump

c Heating elements

CAUTION: TEMPERATURE INDICATOR AND TEMPERATURE CONTROLLER ARE RED LINED AT 310°F (154°C) TO PREVENT INADVERTANT

OVERTEMPERATURE OF OIL AND FORMING OF COKE ON HEATING ELEMENTS.

3 Stabilize at set temperature until ready to service engine.

NOTE: Check for overflow from vent when set temperature is reached. Add oil as necessary to completely fill reservoir.

CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTION USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF THE TUBE OR AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE ETERNAL WIRE BRAID AND IN THE INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(c) Prepare engine for motoring per standard procedure including the following.

1 Remove inlet, duct and tailpipe covers as applicable.

2 Remove rotor and bleed actuator locking devices as applicable.

3 Install necessary air ducts to starter duct system and connect to ground starting units.

4 Remove main oil filter tube assembly (LP01) from engine as follows.

a Remove bolts securing forward end of tube to main oil filter and rear end of tube to top of oil pump. See Figure 1101.

b Remove clamps from tube and remove tube from engine. Discard packings.

5 Install PWA 85525 Adapter to pad on main oil filter housing and secure with bolts.

NOTE: Ensure packing is installed on adapter prior to installation.

6 Install PWA 85526 Adapter to pad on top, rear of oil pump and secure with bolts.

NOTE: Ensure packing is installed on adapter prior to installation.

7 Drain the oil tank by removing the oil tank magnetic chip detector assembly. See 72-00-61, Removal-36 (Task 72-00-61-050-017).

NOTE: You can use the PWA 86018 Adapter to drain the oil from the oil tank as an option to the magnetic chip detector removal.

8 Terminate heat cycle on cart, disconnect power leads and transport cart to service area.

CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTION USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF THE TUBE OR AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE ETERNAL WIRE BRAID AND IN THE INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(d) Service engine. See Servicing-03 (Task 72-00-00-610-003).

1 Connect outlet hose from hot oil cart to adapter on main oil filter housing and inlet hose to adapter on top rear of oil pump.

2 Close vent valve on reservoir.

3 Open inlet and outlet valve to reservoir.

4 Prepare engine for motoring.

CAUTION: RESERVOIR MUST BE FULL, INLET AND OUTLET VALVES OPEN, AND VENT VALVE CLOSED TO PREVENT POSSIBLE DAMAGE TO BEARINGS WHEN MOTORING ENGINE.

5 Motor engine for minimum period of three minutes. Monitor build up and stabilized level of pressure in reservoir during motoring of engine.

6 Terminate motoring of engine.

CAUTION: USE CARE WHEN HANDLING FITTINGS AND LINES AFTER MOTORING TO PREVENT INJURY FROM HOT OIL IN SYSTEMS.

7 Disconnect inlet and outlet lines and remove adapters from main oil filter housing and from top rear of oil pump housing.

8 Install main oil filter tube assembly (LP01) to engine.

a Install packings, lubricated with Engine Oil P03−001, to grooves on both ends of tube.

b Install tube to port on main oil filter housing and port on top rear of oil pump. Secure tube flange on forward end of tube to filter housing with bolts, threads lubricated with Engine Oil P03−001. Secure rear end of tube to pump with bolts, threads
R lubricated with Antiseize Paste P06−054.
R Remove unwanted paste.

c Install clamps to tube as shown in Figure 1101. Secure clamps with bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

d Torque the bolts that attach the tube to the oil filter housing to 85 − 95 lb−in. (9.604 − 10.734 N.m). Torque the bolts that attach the tube to the oil pump to 67 − 72 lb−in. (7.005 − 8.135 N.m).

e Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

9 Install all caps, plugs, and closures on connecting lines and hydraulic system of cart.

10 Prepare engine for installation or storage as applicable.

NOTE: For optimum results, two motoring periods may be run with initial charge, after repeating heating cycle. If oil used in flushing process is to be stored in cart, it is recommended that a heating cycle be run prior to storage to eliminate any condensation and that periodic samples of oil be taken to ensure that no degradation of oil occurs.

Task 72-00-00-610-004:

1. Flush The Engine Oil System

A. Equipment And Materials

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P11-004	Solvent, Cleaning (PMC 9010)

B. Procedure

See Figure 301.

NOTE: If you see "black oil" in the oil system, refer to the inspection for black oil, 72-00-00, Inspection/Check-04 (Task 72-00-00-280-054). Black oil can be an indication of a serious problem or it can be a condition that requires no maintenance action.

WARNING: DO NOT LOOSEN THE OIL TANK CAP OR REMOVE THE MAGNETIC CHIP DETECTORS ASSEMBLIES FOR FIVE MINUTES, MINIMUM, AFTER ENGINE SHUTDOWN (THIS WILL LET THE PRESSURE IN THE OIL TANK BECOME LOWER). HOT OIL CAN CAUSE BURNS. HOT OIL CAN FLOW FROM THE OIL TANK IF THE PRESSURE IS NOT RELEASED.

WARNING: BE CAREFUL WHEN YOU WORK WITH THE OIL SYSTEM AND USE SUFFICIENT PROTECTION FOR THE HANDS AND EYES. THE OIL IS HOT AND CAN CAUSE BURNS.

R R R (1) Drain the oil that is in the engine oil system. See Drain Engine Oil System, 72-00-00, Servicing-01 (Task 72-00-00-610-001).

(2) Fill the oil tank with oil as follows.

(a) Remove the oil tank cap. Refer to 72-00-61, Removal-38 (Task 72-00-61-040-002).

CAUTION: DO NOT USE THE OIL LEVEL INDICATOR TO DO A CHECK OF THE OIL LEVEL. YOU MUST LOOK INSIDE THE OIL TANK TO CORRECTLY MEASURE THE OIL.

(b) Fill the oil tank as follows.

1 (Pre SB PW4ENG 79-18 or Post SB PW4ENG 79-47) Put Engine Oil P03-001 in the filler neck valve until the level of oil reaches the top of the "V".

CAUTION: DO NOT USE THE PRESSURE FILL METHOD. THE MANUAL FILL METHOD ONLY IS PERMITTED.

2 (Post SB PW4ENG 79-18) Put Engine Oil P03-001 in the filler neck valve until the level of oil reaches the bottom of the "V".

(c) Install the oil tank cap. Refer to 72-00-61, Installation-38 Task 72-00-61-040-002.

(3) Motor the engine as follows.

(a) Dry motor the engine until the oil pressure is stable. Do the procedure in 71-00-00, Testing-02 Task 71-00-00-760-029.

(4) Drain the oil system again. Refer to Step (1).

(5) Fill the oil system. Refer to Servicing-02 Task 72-00-00-610-002.

PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

ENGINE GENERAL − STORAGE/TRANSPORT−00

Task 72−00−00−510−001:

1. Transporting Engine By Truck

CAUTION: ALL PW4000 SERIES ENGINE BEING TRANSPORTED BY TRUCK, REQUIRE THAT BOTH TRACTOR AND TRAILER BE EQUIPPED WITH AN AIR SUSPENSION SYSTEM REGARDLESS OF DISTANCE TO BE TRANSPORTED. IT IS STRONGLY RECOMMENDED THAT ALL ENGINE TRANSPORT STANDS BE PURCHASED PER 70−80, STANDARD PRACTICES MANUAL.

A. Transport Engine By Truck And Trailer, Equipped With An Air Suspension System, After Engine Has Been Properly Packaged

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72-00-00-620-001:

1. Preservation Of The Engine For 60 Days Or Less (Method I)

A. General

(1) This task gives instructions to preserve the engine for 60 days or less.

(2) If the engine is to be stored for more than 60 days, refer to Preserve The Engine (For More Than 60 Days).

(3) If you are not sure how much time the engine will not be used, use the preservation procedure that is necessary for the longer time.

(4) As an ALTERNATE procedure for preservation as specified in the following schedules, engines may be left in an inactive status up to seven days with no preservation as long as the following is met:

(a) The engine is sheltered. In other words, keep the engine inside or if kept outside, install a tarp or PVC plastic sheet over the inlet cowl, fan exhaust area and the engine exhaust area.

(b) The humidity is not excessive, not to exceed 60 percent.

(c) The engine is not subjected to extreme temperature changes, which produce condensation.

(d) After a maximum of seven days and every seven days thereafter, counting from the first day of inactivity, the engine should be run up to boil off condensation in the engine oil.

(5) For general preservation procedures, refer to SPOP 428 shown in the Standard Practices Manual, PN 585005.

(a) Refer to the method shown for "New Delivered Engines" for a new engine received from Pratt and Whitney.

(b) (To Preserve Engines For 60 Days Or Less) Refer to "In-Service Engine Going Into Storage For 60 Days Or Less (Method I)" for in service engines.

B. Procedure

(1) Preserve the engine oil system as follows.

(a) Flush the engine oil if the engine was not run within the last seven days. Refer to Drain The Engine Oil System, 72−00−00, Servicing−01 (Task 72−00−00−610−001) and Fill The Engine Oil System, 72−00−00, Servicing−02 (Task 72−00−00−610−002).

NOTE: If the engine was run within the last seven days, it is not necessary to flush the engine oil.

NOTE: You can perform sample testing of the engine oil by ASTM procedure D3604−00 as an option to flushing the engine oil system as specified in the Preservation Method Chart shown in Figure 1201.

(b) Drain the engine oil. Refer to Drain The Engine Oil System, 72−00−00, Servicing−01 (Task 72−00−00−610−001).

(2) Preserve the main gearbox as follows.

CAUTION: DO NOT SPRAY PRESERVATIVE OIL P03−002 INTO THE ENGINE GASPATH AS POSSIBLE DIRT DEPOSITION ON THE BLADES AND VANES WILL REDUCE ENGINE EFFICIENCY.

CAUTION: HYDRAULIC FLUID CAN SERIOUSLY CORRODE THE MAIN GEARBOX HOUSING DURING PROLONGED PERIODS OF INOPERATION. ANY HYDRAULIC FLUID SPILLED ON THE MAIN GEARBOX HOUSING SHOULD BE IMMEDIATELY CLEANED OFF BY THE SPOP 208 WIPE METHOD OF THE Standard Practices Manual, PN 585005.

(a) Examine the main gearbox for hydraulic fluid on the gearbox housing. If necessary, remove hydraulic fluid as follows:

1 Use aqueous cleaner to degrease the engine externals by SPOP 1 (Task 70−21−00−110−047). Refer to Standard Practices Manual, PN 585005.

2 Solvent wipe Degrease the engine externals by SPOP 208 (Task 70−21−00−110−040). Refer to Standard Practices Manual, PN 585005.

(b) If any gearbox accessories have been removed, do the steps that follow.

1 Spray Engine Oil P03-001 on the gearbox drive pad.

2 Install a covers on the gearbox drive pad.

(3) Seal the engine for storage as follows.

(a) Install all necessary caps, plugs and covers over all bleed valve openings, hoses, electrical connectors and other openings.

R (b) You must store the engine inside, or if kept
R outside do as follows:

R 1 Install a cover, tarp or PVC plastic sheet over the engine intake area and fan discharge area.

R 2 Install a cover, tarp or PVC plastic sheet over the engine exhaust area.

(4) Make a preservation record for each engine as follows:

(a) Record the method of the preservation.

(b) Record the date of the preservation.

(5) If the engine will stay in storage after the initial 60 days, you must do one of the options that follow. See Figure 1201.

(a) OPTION 1: Preserve the engine by Method II (Task 72-00-00-610-005).

NOTE: The Preservation Of The Engine For More Than 60 Days (Method II) requires both the Oil System and Fuel System preservation.

(b) OPTION 2: Run (operate) the engine, as necessary. Refer to the procedure specified in SPOP 428 (Task 70-80-00-620-001).

NOTE: It is permitted to use OPTION 2 only when Method I is repeated a maximum of one time (that is, it can not be used if the engine will stay in storage more than 120 days).

1 The referenced procedures specified in SPOP 428 are as follows:

- a Service the oil system. Refer to Drain The Engine Oil System, 72-00-00, Servicing-01 (Task 72-00-00-610-001) and Fill The Engine Oil System, 72-00-00, Servicing-02 (Task 72-00-00-610-002).
- b Start the engine. Refer to 71-00-00, Testing-00 (Task 71-00-00-760-003).
- c Do an engine shutdown by the Normal Engine Shutdown Procedure. Refer to 71-00-00, Testing-00 (Task 71-00-00-760-004).

Task 72-00-00-610-005:

2. Preservation Of The Engine For More Than 60 Days (Method II)

A. General

(1) This task gives instructions to preserve the engine when it is stored for more than 60 days.

(2) It will be necessary to air motor or run the engine in a test cell to preserve the engine for more than 60 days.

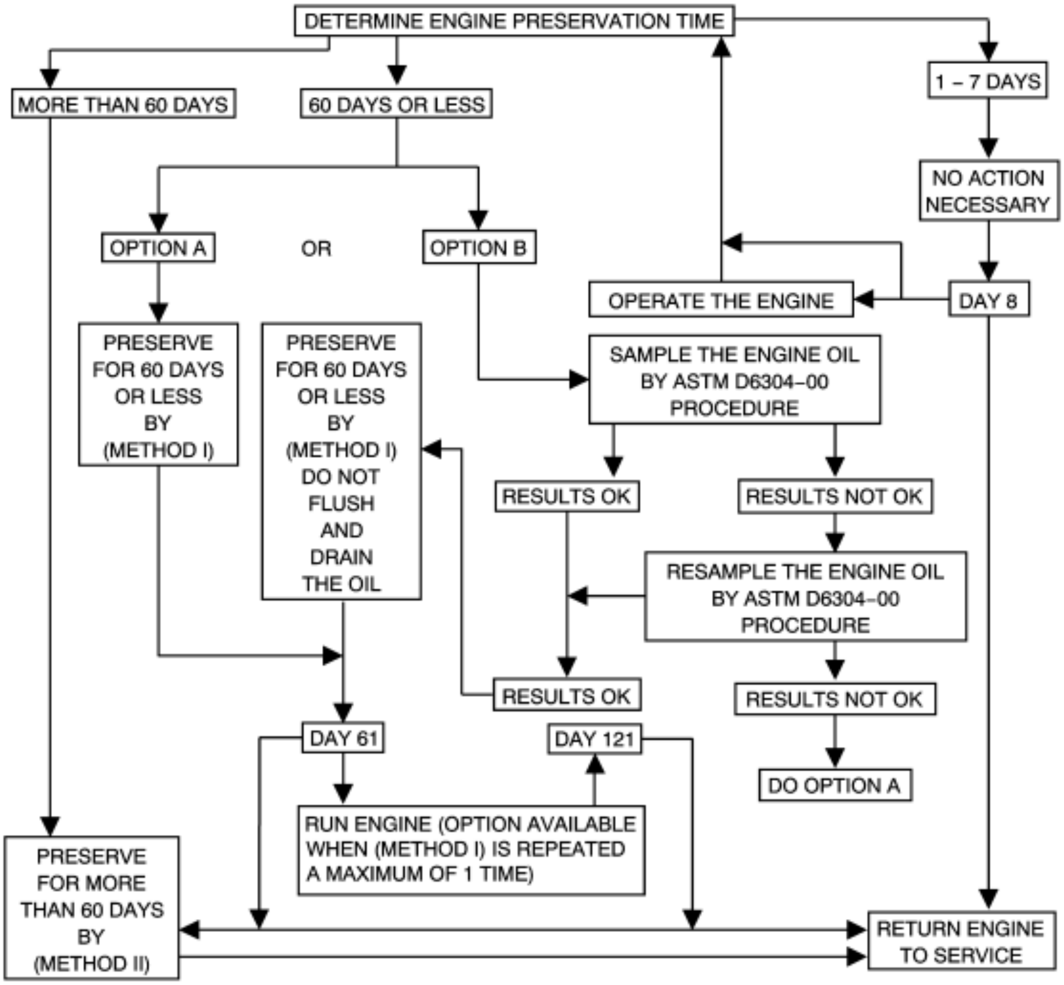
(3) For general preservation procedures, refer to SPOP 428 shown in the Standard Practices Manual, PN 585005. Refer to the method shown for "Preservation Of Engine For More Than 60 Days (Method II)".

B. Equipment And Materials Necessary

Standard Tools:
CTE 3160 Cart, Preservation or Equivalent

Special Tools:

PWA 85433	Adapter, Fuel Preserve, Fuel Pump Inlet
PWA 85451	Adapter, Fuel Preserve, Fuel Flowmeter Outlet
PWA 86018	Adapter, Oil Sampler (Optional)



DETERMINE ENGINE PRESERVATION TIME
MORE THAN 60 DAYS

RUN ENGINE (OPTION AVAILABLE WHEN (METHOD I) IS REPEATED A MAXIMUM OF 1 TIME)
PRESERVE FOR MORE THAN 60 DAYS BY (METHOD II)
RETURN ENGINE TO SERVICE

NOTES TO THE PRESERVATION CHART:

1. THIS CHART DOES NOT SPECIFY ALL THE STEPS BY SPOP 428 (REFER TO SPOP 428 FOR DETAILS).
2. SAMPLING OPTION IS RESTRICTED TO ONE 60 DAY PERIOD.
3. IN OPTION B, OIL SYSTEM FLUSH IS NOT NECESSARY (REF. METHOD I) IF SAMPLE TEST RESULTS ARE OK.
4. WHEN PRESERVING FOR MORE THAN 60 DAYS, FUEL SYSTEM PRESERVATION IS ALSO REQUIRED.
5. IF THE ENGINE WILL STAY IN STORAGE AFTER 60 DAYS (METHOD I), YOU CAN PRESERVE THE ENGINE AGAIN AFTER THE INITIAL 60-DAY PERIOD. SEE TEXT FOR INSTRUCTIONS.

ENGINE GENERAL - STORAGE/TRANSPORT-03

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P03-002	Oil, Lubricating (PMC 9852)
R P06-053	Lubricant, Sealing Ring (PWA 36500)
P15-001	Dehydrator

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Fuel Filter Element	1	73-12-00/2/10
Packing	1	73-12-00/2/20
Packing	3	73-12-00/2/60
Packing	2	73-13-00/4/70
Packing	1	73-13-00/5/30
Oil Filter Element	1	79-21-00/2/140
Packing	1	72-61-00/12/270
Packing	1	79-11-00/2/1
Packing	1	79-21-00/2/180
Packing	1	79-21-00/2/230

C. Procedure

(1) Preserve the engine oil system as follows.

(a) If necessary, remove protective covers form the engine.

(b) Drain and fill the engine oil. Refer to Drain The Engine Oil System, 72-00-00, Servicing-01 (Task 72-00-00-610-001) and Fill The Engine Oil System, 72-00-00, Servicing-01 (Task 72-00-00-610-002).

NOTE: You must replace the oil filter element when you change the oil.

R (2) Air motor the engine by the Test Cell (Method A) or Transport Stand (Method B) as specified in SPOP 428 (Task 70-80-00-620-001), Section 70-80-00, Standard Practices Manual, PN 585005 and as follows:

R (a) When specified in SPOP 428, the referenced Engine Manual procedures are as follows:

R R 1 Start the engine. Refer to 71-00-00, Testing-00 (Task 71-00-00-760-003).

R R R 2 Do an engine shutdown by the Normal Engine Shutdown Procedure. Refer to 71-00-00, Testing-00 (Task 71-00-00-760-004).

R R R 3 Dry motor the engine with the starter. Refer to 71-00-00, Power Plant General Testing-00 (Task 71-00-00-760-007)

R R R R 4 Install the starter (if not previously installed). Refer to 71-00-61, Installation-04 (Task 71-00-61-450-014). Be sure the starter is serviced.

(3) Ground run the engine, (optional to motor procedure).

NOTE: You can use this method for engine motoring when a test cell is not available.

(a) Start the engine. See 71-00-00, Testing-00 (Task 71-00-00-760-003) Engine Starting, Procedure (Normal).

(b) Operate the engine as required until the oil temperature is 220°F (104.4°C) or more. Continue to operate the engine for 5 minutes. Return engine to MIN IDLE and allow engine to stabilize for 5 minutes.

(c) Do an engine shutdown by the Normal Engine Shutdown Procedure, See 71-00-00, Testing-00 (Task 71-00-00-760-004).

(d) For engines that can not be started and operated, motor the engine with the starter at a starter inlet air pressure of 15 psig (103.4 kPa) minimum. Make sure that the fan (LPC) is turning during motoring. If necessary increase the starter inlet air pressure to turn the fan (LPC). The maximum starter inlet air pressure is 50 psig (344.7 kPa). Continue to motor the engine for five minutes. This will flow the oil through the engine. Be sure not to exceed the starter operation time limits.

(4) Motor the engine in the transport stand (optional to engine operation).

(a) Install the starter (if not previously installed). See 71-00-61, Installation-04 (Task 71-00-61-450-014). Be sure the starter is serviced.

(b) Remove the engine hydraulic pumps.

(c) Connect the external supply pressure source to before the starter air valve.

NOTE: You can use a standard aircraft pneumatic start cart and a locally manufactured coupling to connect the eternal supply pressure source to the starter air valve.

(d) If any of the accessories were removed from the main gearbox, make sure the pad covers and gaskets are installed. Put a cap on the pad cavity drains to prevent the loss of engine oil.

(e) Make sure that no lines in the fuel and oil system were disconnected and/or removed. If necessary, connect and/or install the lines by the applicable procedures.

(f) Use a wrench and extension to manually open the starter air valve.

CAUTION: DO NOT OPERATE THE STARTER FOR MORE THAN THE STARTER TIME LIMIT AND PRESSURE LIMIT. IF YOU DO, YOU CAN CAUSE DAMAGE TO THE STARTER.

(g) Dry motor the engine with the starter for 3 minutes. See 71-00-00, Power Plant General Testing-00 (Task 71-00-00-760-007). If necessary increase the starter inlet air pressure to turn the fan (LPC). The maximum starter inlet air pressure is 50 psi (344.7 kPa).

NOTE: When you motor the engine, the fan (LPC) must turn. This is necessary to get oil through all the engine oil systems.

(h) Stop motoring the engine and permit the engine to come to a complete stop.

NOTE: Do not drain the engine oil until after you preserve the fuel system.

(5) Preserve the engine fuel system (Optional Pressure Feed Method) See Figure 1202, Figure 1203, Figure 1204, Figure 1205, Figure 1206, and Figure 1207.

NOTE: The Pressure Feed Method is optional to the Gravity Feed Method and Test Stand Method.

(a) Remove the lockwire and drain plugs for the FP1 and FP3 ports of the fuel pump. Let the fuel drain into a 5 U.S. gallons (19 liters) fluid drain container.

(b) Drain the fuel system as follows:

1 If installed, disconnect the main fuel supply line as follows:

a Remove the four bolts and washers that attach the line to the pump.

b Disengage the line and remove the gasket.

(c) Remove the fuel pump filter. See 72-00-61, Removal-24 (Task 72-00-61-060-001).

(d) Install the new fuel pump filter. See 72-00-61, Installation-24 (Task 72-00-61-460-001).

(e) Install the PWA 85451 Adapter to the fuel flowmeter as follows:

1 Remove the lockwire and eight bolts that attach the rear fuel flowmeter support. Remove the support.

2 Move the transfer tube rearward into the fuel distribution valve strainer cover. Remove the four bolts and washers that attach the cover to the valve. Remove the cover and transfer tube together as a unit.

3 Install the PWA 85451 Adapter with the gasket and four bolts to the fuel flowmeter outlet.

4 Attach a hose to the adapter. Put the other end in a container with a minimum capacity of 5 U.S. gallons (19 liters).

(f) Install the PWA 85433 Adapter with the gasket and four nuts to the fuel pump inlet.

(g) Install the two drain plugs with the new packings, lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053. Torque the plugs to 45 - 55 lb-in. (5.084 - 6.214 N.m). Install the lockwire.

CAUTION: BE SURE THE PRESERVATION CART HAS FILTERS OR STRAINERS OF NO COARSER MESH THAN USED IN THE ENGINE FUEL SYSTEM.

CAUTION: DO NOT SPRAY PRESERVATION OIL P03-002 INTO THE ENGINE GASPATH. THE OIL CAN CAUSE UNWANTED MATERIAL TO STICK TO THE BLADES AND VANES. REDUCED ENGINE PERFORMANCE CAN RESULT.

CAUTION: MAKE SURE THE ENGINE OIL SYSTEM HAS THE CORRECT AMOUNT OF OIL IN THE SYSTEM OR DAMAGE TO THE ENGINE CAN OCCUR.

(h) Attach the Fuel Accessory Preservation Cart Assembly CTE 3160 or equivalent pressure hose to the PWA 85433 Adapter on the fuel pump inlet port.

(i) Make sure the preservation cart is away from the engine inlet, exhaust and fan discharge area(s).

R
R
R (j) In the following steps, use the airframe electrical connector J3 on the fuel metering unit (called FMU) (with a 28 volt DC power source) to power up the Start/Run solenoid and power up the Shut-off solenoid with the FMU. The airframe connector pin identifiers are as follows:

1 Pins 3 (+) and 4 (-) are powered for Start (to allow flow through the FMU).

2 Pins 1 and 6 (+) and 14 (-) are powered for Shut-Off (stop flow through the FMU).

(k) Use the cart and flush Lubricating Oil P03-002, at a pressure of 5 - 25 psig (34.5 - 172.4 kPa) and at 60°F (15.6°C) minimum, and wet motor the engine (See 71-00-00, Testing-02, Task 71-00-00-760-029) until approximately 2 U.S. gallons (8 liters) is discharged into the fluid drain container.

(l) Stop the wet motor and the pump on the fuel accessory preservation cart and disconnect the cart and let the system drain.

(m) Remove the adapters and gasket from the rear of the fuel flowmeter and the fuel pump inlet port.

(n) Connect the main fuel supply line as follows:

1 Install a new gasket and the main fuel supply line flange to the fuel pump port.

2 Install the four bolts and washers. Torque the bolts to 180 - 200 lb-in. (20.337 - 22.597 N.m).

(o) Install the fuel flowmeter transfer tube and rear support as follows:

1 Install the two new packings, lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 to the transfer tube. Install the transfer tube to the fuel distribution valve strainer cover.

2 Install a new packing, lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 to the strainer cover. Install the cover and transfer tube to the fuel distribution valve and attach with the four bolts, lubricated with Engine Oil P03-001, and washers. Torque the bolts to 30 - 33 lb-in. (3.390 - 3.728 N.m).

3 Slide the transfer tube forward and engage the fuel flowmeter and dowel pin. Place the support in position and align the brackets. Install the eight bolts, lubricated with Engine Oil P03-001.

NOTE: Install the drilled head bolts to the front.

4 Torque the eight bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m). Install the lockwire to the front four bolts.

(p) Write the date and the method of preservation on a tag and attach it to the fuel metering unit.

(6) Preserve the engine fuel system (Optional Gravity Feed Method) as follows.

NOTE: The Gravity Feed Method is optional to the Pressure Feed Method and Test Stand Method.

(a) Remove the lockwire and drain plugs for the FP1 and FP3 ports of the fuel pump. Let the fuel drain into a 5 U.S. gallons (19 liters) fluid drain container.

(b) If installed, disconnect the main fuel supply line as follows:

1 Remove the four bolts and washers that attach the line to the pump.

2 Disengage the line and remove the gasket.

(c) Remove the fuel pump filter. See 72-00-61, Removal-24 (Task 72-00-61-060-001).

(d) Install the new fuel pump filter. See 72-00-61, Installation-24 (Task 72-00-61-460-001).

(e) Install the PWA 85451 Adapter to the fuel flowmeter as follows:

1 Remove the lockwire and eight bolts that attach the rear fuel flowmeter support. Remove the support.

2 Move the transfer tube rearward into the fuel distribution valve strainer cover. Remove the four bolts and washers that attach the cover to the valve. Remove the cover and transfer tube together as a unit.

3 Install the PWA 85451 Adapter with the gasket and four bolts to the fuel flowmeter outlet.

4 Attach a hose to the adapter. Put the other end in a container with a minimum capacity of 5 U.S. gallons (19 liters).

(f) Install the PWA 85433 Adapter with the gasket and four nuts to the fuel pump inlet.

R
R

(g) Install the two drain plugs with the new packings, lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053. Torque the plugs to 45 - 55 lb-in. (5.084 - 6.214 N.m). Install the lockwire.

CAUTION: DO NOT SPRAY PRESERVATION OIL P03-002 INTO THE ENGINE GASPATH. THE OIL CAN CAUSE UNWANTED MATERIAL TO STICK TO THE BLADES AND VANES. REDUCED ENGINE PERFORMANCE CAN RESULT.

CAUTION: MAKE SURE THE ENGINE OIL SYSTEM HAS THE CORRECT AMOUNT OF OIL IN THE SYSTEM OR DAMAGE TO THE ENGINE CAN OCCUR.

(h) Use a clean dry tank with a capacity of 5 - 10 U.S. gallons (19 - 38 liters) and assemble a gravity feed preservation tank as follows:

1 The tank must be vented and have a fitting at the bottom to attach a valve and hose.

NOTE: The hose must be 0.5 inch (12.70 mm) inside diameter (ID) minimum, approximately 20 feet (6.10 m) in length, and must not collapse under negative pressure.

2 Install a shutoff valve to the bottom of the tank with an in-line 40 micron filter.

3 Attach the hose to the PWA 85433 Adapter on the fuel pump inlet port.

4 Position the tank away from the engine fan discharge air and 5 feet (1.52 m) minimum above the fuel pump inlet.

5 Shut the valve at the bottom of the tank.

6 Fill the tank with 5 U.S. gallons (19 liters) minimum of Flushing Oil P03-002.

R (i) In the following steps, use the airframe electrical connector J3 on the FMU (with a 28 volt DC power source) to power up the Start/Run solenoid and power up the Shut-off solenoid with the FMU. The airframe connector pin identifiers are as follows:

R 1 Pins 3 (+) and 4 (-) are powered for Start (to allow flow through the FMU).

R 2 Pins 1 and 6 (+) and 14 (-) are powered for Shut-Off (stop flow through the FMU).

R (j) Open the valve at the bottom of the tank and wet motor the engine (see 71-00-00, Testing-02, (Task 71-00-00-760-029)) until approximately 2 U.S. gallons (8 liters) of flushing oil comes out of the drain adapter and into the fluid drain container.

R (k) Stop the wet motor and close the valve at the bottom of the tank.

R (l) Disconnect the hose and let the fuel system drain.

R (m) Remove the adapters and gasket from the rear of the fuel flowmeter and the fuel pump inlet port.

R (n) Connect the main fuel supply line as follows:

1 Install a new gasket and the main fuel supply line flange to the fuel pump port.

2 Install the four bolts and washers. Torque the bolts to 180 - 200 lb-in. (20.337 - 22.597 N.m).

R (o) Install the fuel flowmeter transfer tube and rear support as follows:

1 Install the two new packings, lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 to the transfer tube. Install the transfer tube to the fuel distribution valve strainer cover.

2 Install a new packing, lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 to the strainer cover. Install the cover and transfer tube to the fuel distribution valve and attach with the four bolts, lubricated with Engine Oil P03-001, and washers. Torque the bolts to 30 - 33 lb-in. (3.390 - 3.728 N.m).

3 Slide the transfer tube forward and engage the fuel flowmeter and dowel pin. Place the support in position and align the brackets. Install the eight bolts, lubricated with Engine Oil P03-001.

NOTE: Install the drilled head bolts to the front.

4 Torque the eight bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m). Install the lockwire to the front four bolts.

R (p) Write the date and the method of preservation on a tag and attach it to the fuel metering unit.

(7) Preserve the engine fuel system (Optional Test Cell Method) as follows:

NOTE: The Test Cell Method is optional to the Pressure Feed Method and Gravity Feed Method.

(a) After all testing is complete, prior to shut-down, shut off the main fuel supply from the test cell to the engine.

(b) Pump Flushing Oil P03-002 from the test cell main fuel supply to the engine.

(c) Operate the engine at idle until white smoke comes out the tail pipe. Refer to Test No. 3 - Idle Power Test, 71-00-00, Testing-03 (Task 71-00-00-760-030).

(d) Do an engine shutdown by the Normal Engine Shutdown Procedure. See 71-00-00, Power Plant General - Testing-00 (Task 71-00-00-760-004).

(8) Drain the engine oil from the oil tank and main gearbox. Remove the magnetic chip detectors and main oil filter element. See 72-00-00, Servicing-01 (Task 72-00-00-610-001).

(9) Perserve the main gearbox as follows.

CAUTION: DO NOT LET AIRCRAFT HYDRAULIC FLUID STAY ON THE MAIN GEARBOX DURING THE PRESERVATION TIME. THE HYDRAULIC FLUID CAN CAUSE CORROSION AND DAMAGE TO THE GEARBOX HOUSING. CLEAN ALL THE HYDRAULIC FLUID FROM THE GEARBOX BEFORE THE ENGINE IS PRESERVED. USE SPOP 208 TO CLEAN THE HOUSING.

(a) Examine the main gearbox for hydraulic fluid on the gearbox housings. If necessary, remove any hydraulic fluid as follows.

1 Use aqueous cleaner to degrease the engine externals by SPOP 1 (Task 70-21-00-110-047). Refer to Standard Practices Manual, PN 585005.

2 Solvent wipe Degrease the engine externals by SPOP 208 (Task 70-21-00-110-040). Refer to Standard Practices Manual, PN 585005.

(b) Examine the hydraulic pump overboard drain tube(s) for any hydraulic fluid leakage.

(c) If any of the accessories are removed from the main gearbox and covers are installed do as follows:

1 Remove the covers.

2 Spray Engine Oil P03-001 on the gearbox drive pads.

3 Install the accessory gearbox covers on the gearbox again.

(10) Preserve the engine for relative humidity as follows.

(a) It is recommended that the relative humidity be at 40 percent or less inside the engine during the preservation time for optimal preservation.

CAUTION: DO NOT PUT THE DEHYDRATING AGENT (DESICCANT) NEAR THE FAN OR TURBINE BLADES BECAUSE THE ROTATION OF THE BLADES CAN CAUSE THE DESICCANT BAGS TO TEAR.

R (b) Put 25 - 125 lb (11.34 - 56.70 kg) of Dehydrator P15-001 in the bottom of the engine bag. Put half in the inlet and half in the tail pipe areas.

(c) Put relative humidity indicators inside the inlet and exhaust areas.

(11) Seal the engine for storage as follows.

(a) Seal all the engine and thrust reverser openings. Install a tarp or PVC plastic sheet over the intake area, fan exhaust area and the engine exhaust area.

(b) The protective covers must have windows so that you can see the relative humidity indicators inside the engine.

(12) Examine the engine during preservation every 15 days
R (or less) by the instructions specified in SPOP 428
R (Task 70-80-00-620-001). Refer to Section 70-80-00, Standard Practices Manual, PN 585005.

(13) Make a preservation record for each engine as follows.

(a) Record the method of the preservation.

(b) Record the date of the preservation.

(c) Record the procedures used for the oil (oil drained) and fuel systems (flushing oil).

Task 72-00-00-620-002:

1. Accomplish Engine Depreservation

A. General

(1) This task gives the instructions to put the engine back into service after preservation.

(2) To depreserve an engine that was preserved for more than 60 days, it will be necessary to run the engine in a test cell.

(3) For general depreservation procedures, refer to SPOP 428 shown in the Standard Practices Manual, PN 585005.

NOTE: Transport the engine to a test cell or to an aircraft for a test run. Transport the engine by an approved method only to prevent damage to the engine.

(a) Refer to the method shown for "Depreservation of the engine for engines preserved for 60 days or less (Method I)".

(b) Refer to the method shown for "Depreservation of the engine for engines preserved for more than 60 days (Method II)".

B. Equipment And Materials Necessary - None

C. Depreservation Procedure For Engines That Were Preserved For 60 days Or Less

(1) Remove all covers, tarps or PVC plastic sheets from the engine intake and exhaust area.

(2) Depreserve the main gearbox as follows.

(a) Examine the main gearbox for corrosion damage from hydraulic fluid.

(b) If necessary, repair any hydraulic fluid leaks.

(c) If any gearbox accessories have been removed, do the steps that follow.

1 Remove the covers on the gearbox drive pads.

2 Install the gearbox accessories.

(3) Fill the engine oil system. See 72-00-00, Engine General Servicing-02, (Task 72-00-00-610-002).

D. Depreservation Procedure For Engines That Were Preserved For More Than 60 days

(1) Remove all covers, tarps or PVC plastic sheets from the engine intake and exhaust area.

(2) Remove all dehydrating agents from inside the engine.

(3) Depreserve the main gearbox as follows.

(a) Examine the main gearbox for corrosion damage from hydraulic fluid.

(b) If necessary, repair any hydraulic fluid leaks.

(c) If any gearbox accessories have been removed, do the steps that follow.

1 Remove the covers on the gearbox drive pads.

2 Install the gearbox accessories.

(4) Fill the engine oil system. See 72-00-00, Engine General Servicing-02, (Task 72-00-00-610-002).

(5) Wet motor the engine with the starter until fuel comes out the exhaust. See 71-00-00, Power Plant General - Testing-00, (Task 71-00-00-760-010).

(6) Start the engine by the Normal Engine Start Procedure. See 71-00-00 Power Plant General - Testing-00, (Task 71-00-00-760-003).

(7) Operate the engine at idle power to burn off the remaining flushing oil in the fuel system.

(8) Do Test No. 3 Idle Power Test and check the fuel and oil systems for leaks. See 71-00-00, Power Plant General - Testing-03, (Task 71-00-00-760-030).

(9) Do an engine shutdown by the Normal Engine Shutdown Procedure. See 71-00-00, Power Plant General - Testing-00, (Task 71-00-00-760-004).

(10) Do all the other depreservation steps shown in SPOP 428 for engines preserved for more than 60 days.

ENGINE GENERAL - STORAGE/TRANSPORT-05

Task 72-00-00-510-004:

1. Remove The Supplemental Control Unit (SCU) From Flight Position On The Fan Case For Engine Transport

NOTE: This procedure gives instructions for the removal of the supplemental control unit (SCU) from the right side of the fan case for engine transport.

A. Equipment And Materials Required

Special Tools:
P60165 Container, Shipping, Reusable, SCU

B. Procedure

See Figure 1201.

NOTE: Two persons are necessary to do the following procedure.

(1) Disconnect the connector assembly (SCU programming plug) (1201/4) from the lower rear side connector of the supplemental control unit. Keep the connector assembly attached to the engine by its lanyard.

(2) Disconnect the W11P34 connector (1201/1) and the W11P33 connector (1201/2) from the rear side of the supplemental control unit.

(3) Remove the bolt (1201/7) from the top rear side of the supplemental control unit and disconnect the ground cable.

(4) If the supplemental control unit has the multiplexing option, disconnect the top connector of the hose assembly (1201/3) from the bottom side of the supplemental control unit.

(5) Have another person hold the supplemental control unit (SCU) and remove the bolts (1201/5) and washers (1201/6) from the mounts at the four corners. Remove the supplemental control unit (SCU) from the engine.

(6) Install protection covers to the openings and electrical connectors on the supplemental control unit, the wiring harness and the SCU programming plug.

(7) Attach the wiring harness connectors (W11P33 and W11P34) and the connector assembly (SCU programming plug) (1201/4) to the supplemental control unit (SCU) mount brackets.

(8) Install the four bolts (1201/5) and four washers (1201/6) to the supplemental control unit (SCU) mount brackets sufficiently to engage the locking feature.

(9) Put the supplemental control unit (SCU) in the P60165 Shipping Container and attach the container to the fork lift tunnel on the transport stand at the rear of the engine.

Task 72-00-00-510-005:

1. Install The Supplemental Control Unit (SCU) To Flight Position On The Fan Case After Engine Transport

NOTE: This procedure gives instructions for the installation of the supplemental control unit (SCU) to the right side of the fan case after engine transport.

A. Equipment And Materials Required

Standard Tools:
Glenair TG-70 Strap Wrench or
Glenair TG-69 Soft Jawed Pliers
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P11-014	Alcohol, Isopropyl (PMC 9094)

B. Procedure

See Figure 1201.

NOTE: Two persons are necessary to do the procedure that follows.

(1) Remove the supplemental control unit from the shipping container attached to the fork lift tunnel on the transport stand at the rear of the engine.

(2) Remove the four bolts (1201/5) and four washers (1201/6) from the supplemental control unit (SCU) mount brackets on the right side of the fan case.

(3) Release the wiring harness connectors (W11P33 and W11P34) and the connector assembly (SCU programming plug) from the SCU mount brackets.

(4) Remove the protection covers from the openings and the electrical connectors on the supplemental control unit, the wiring harness and the SCU programming plug.

(5) With two persons, install the supplemental control unit to the mount brackets on the fan case at approximately the 2:30 o'clock position with the electrical connectors rearward. Attach the supplemental control unit to the brackets with four bolts (1201/5) and washers (1201/6), threads lubricated with Engine Oil (P03−001). Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

CAUTION: BEFORE YOU CONNECT THE GROUND CABLE TO THE SCU, EXAMINE THE CABLE MOUNTING LUGS TO MAKE SURE THE LUGS ARE SECURED TO THE CABLE AND THE CABLE WIRE (STRANDS) ARE AT LEAST 75 PERCENT NOT BROKEN. LOOSE LUGS OR TOO MANY BROKEN WIRES (STRANDS) CAN NOT GIVE SUFFICIENT PROTECTION FROM A LIGHTNING STRIKE.

(6) Put the ground cable to the threaded hole in the top rear side of the supplemental control unit. Attach the cable to the supplemental control unit with a bolt (1201/7), threads lubricated with Engine Oil (P03−001). Torque the bolt to 85 − 95 lb−in. (9.604 − 10.734 N.m).

CAUTION: DO NOT USE LUBRICANTS ON THE SENSING HOSE, OR GASKET UNLESS SPECIFIED DIFFERENTLY. LUBRICANT CAN CAUSE CONTAMINATION OF THE SCU.

(7) If the supplemental control unit has the multiplexing option, install the top hose connector of the hose assembly (1201/3) to the bottom side of the supplemental control unit. Torque the hose connector to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire (P05−289) or Safety Cable (P05−291) and Safety Cable Ferrule (P05−292).

(8) Connect the W11P34 (1201/1) and the W11P33 (1201/2) harness connectors to the mating SCU harness receptacles as follows. For each connector:

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Isopropyl Alcohol (P11−014). Let dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the (Glenair TG−70) strap wrench or the (Glenair TG−69) soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).

This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

See the instructions given with the strap wrench for correct use.

(9) Connect the SCU programming plug (1201/4) to the mating SCU receptacle as follows.

(a) Remove the protection covers. Examine the programming plug and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the plug and receptacle with Isopropyl Alcohol (P11−014). Let dry.

(b) Align the plug keyways and engage the plug to the mating receptacle. Tighten the plug coupling nut by hand until you cover the witness (color) band and the plug coupling nut is hand tight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the plug coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN PLUG DAMAGE OR A LOOSE PLUG. A LOOSE PLUG PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the (Glenair TG−70) strap wrench or the (Glenair TG−69) soft−jawed pliers and tighten the plug coupling nut. Use sufficient force to be sure:
- the plug coupling nut is fully tight
- the plug fits tightly against the receptacle (metal to metal).

This procedure will make sure the contacts are sufficiently engaged and the plug is tight.

NOTE: If you use too much force, the tools (above) will turn around on the plug coupling nut. This will prevent too much torque.

See the instructions given with the strap wrench for correct use.

Pratt & Whitney

PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

Tab Separator - Storage/Transport

List of Effective Pages - Storage/Transport
See end of list.

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72-00-31-020-003:

1. Remove Low Pressure Compressor (LPC)

NOTE: See Figure 301 for part/assembly removal procedure sequence.

A. Prerequisites

(1) Remove electronic engine control (EEC) speed transducer (N1). See 72-00-34, Removal-03 Task 72-00-34-050-001.

(2) Remove compressor inlet cone. See Removal-02 Task 72-00-31-020-001.

(3) Remove all Stage 1 LPC blade assemblies. See Removal-04 (Task 72-00-31-020-002-002).

(4) Remove LPC/LPT coupling. See 72-00-32, Removal-01 Task 72-00-32-020-001.

B. Equipment And Materials Necessary

Special Tools:
PWA 28657 Sling
PWA 76154 Adapter, Lift And Trunnion (2 Required)
PWA 85292 Adapter, Torque (Optional To PWA 86227)
PWA 85520 Fixture, Install And Remove
PWA 85521 Arm, Lifting
PWA 85584 Protector, Plastic
PWA 85660 Stand, Build/Storage (Optional To PWA 88183)
PWA 85685 Puller, Knocker
PWA 86227 Adapter, Torque
PWA 88183 Stand, Build/Storage

Standard Tools:
0.375 - 24 x 1 3/4 Inch Allen Head Bolts
0.190 - 32 x 1 Inch Hex Head Bolts

C. Procedure
See Figure 302.

R (1) Remove the 36 screws that attach the fan exit
R fairing (splitter). If necessary you can use one of
R the penetrating oils specified in SPOP 427 (Task
R 70-00-00-050-001) to help remove the screws. Refer to
R Section 70-00-00 in the Standard Practices Manual, PN
R 585005.

(2) Position PWA 85685 Puller, small tooth side, in one of nine slots on rear OD of fairing. Remove fairing until able to use opposite side of puller jaw to complete removal of fairing.

(3) Remove 38 bolts from No. 1 bearing to No. 1 bearing front support with PWA 86227 or PWA 85292 Adapter. If the engine has a No. 1 bearing vibration transducer, this includes the two bolts and washers that attach the transducer to the front support. Leave two equally spaced.

(4) Remove 46 bolts and washers from LPC compressor stator assembly to fan exit case and vane assembly. Leave four equally spaced.

(5) Attach PWA 85521 Arm to PWA 85520 Fixture using six shoulder screws and washers. Using hoist raise arm and fixture.

(6) Position fixture to LPC and secure to LPC hub using 19 bolts and to shroud using six clamps.

(7) Remove remaining bolts securing No. 1 bearing and LPC stators.

CAUTION: DO NOT EXCEED RECOMMENDED TORQUE LIMIT OF 26 LB−IN. (2.938 N.m) OR DAMAGE TO LPC STATOR ASSEMBLY COULD RESULT.

(8) Insert three jackscrews in threaded holes of No. 1 bearing front support. Install eight jackscrews in threaded holes of LPC compressor stator assembly. Using jackscrews simultaneously remove low pressure compressor from engine. A torque limit of 26 lb−in. (2.939 N.m) should be used on LPC stator jackscrews during removal.

(9) Remove packing from carbon seal support and discard. Remove packing from stator and discard. Install PWA 85584 Protector over bearing and seal assembly.

WARNING: USE SPOOLS ON PWA 85520 FIXTURE MARKED "LIFT FIXTURE AND LPC MODULE ONLY" WHEN TRUNNIONING LPC MODULE. FAILURE TO USE CORRECT SPOOLS

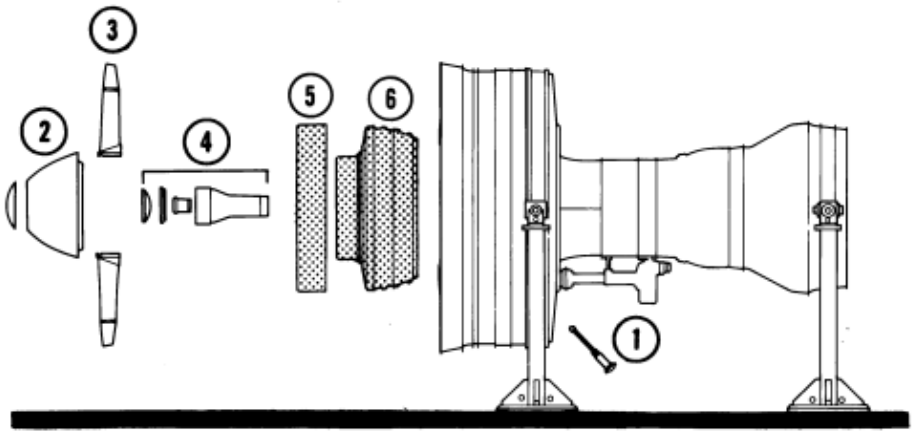
COULD RESULT IN INJURY TO PERSONNEL AND/OR PARTS.

(10) Attach hoist to PWA 28657 Sling with with two PWA 76154 Adapter and slip onto spools of fixture.

NOTE: If No. 1 bearing is to be removed trunnion LPC assembly to front end down on bench, pallet or floor.

(11) Trunnion LPC assembly to front end up and lower onto either PWA 88183 or PWA 85660 Stand. Remove fixture from LPC. Remove hoist, sling, and adapters from fixture. Remove arm from fixture.

ENGINE GENERAL - LOW PRESSURE COMPRESSOR (LPC) - REMOVAL-01



1. REMOVE ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).
2. REMOVE COMPRESSOR INLET CONE.
3. REMOVE STAGE 1 LPC BLADE ASSEMBLIES.
4. REMOVE LPC/LPT COUPLING.
5. REMOVE FAN EXIT FAIRING.
6. REMOVE LOW PRESSURE COMPRESSOR (LPC).

ENGINE GENERAL - LOW PRESSURE COMPRESSOR (LPC) - REMOVAL-02

Task 72-00-31-020-001:

1. Remove Compressor Inlet Cone
   A. Equipment And Materials Required

Special Tools:
PWA 86122 Puller, Knocker

Consumable Materials:

Item No.	Designation
P05-045	Pen, Marking

B. Procedure
See Figures 301 and 302.

(1) Using Marking Pen (P05-045), or equivalent, mark the inlet cone front segment, the inlet cone (rear) segment, and the front compressor hub to ensure alignment during reinstallation.

(2) Remove six bolts and washers securing compressor inlet cone front segment to compressor inlet cone (rear) segment assembly and remove front segment.

(3) Remove 19 bolts and washers securing compressor inlet cone (rear) segment assembly to front compressor hub assembly.

CAUTION: DAMAGE TO NUT PLATES AND/OR INLET CONE CAN OCCUR IF PWA 86122 PULLER IS NOT INSTALLED BETWEEN INLET CONE NUT PLATES.

(4) Install PWA 86122 Puller to the inner side of inlet cone. Precaution must be used not to install puller on inlet cone nut plates. See Figure 302.

(5) Remove compressor inlet cone (rear) segment assembly and place on pallet or workbench.

ENGINE GENERAL - LOW PRESSURE COMPRESSOR (LPC) - REMOVAL-03

Task 72-00-31-020-002-001:

1. Remove Individual Or Matched Moment Weighted Set Of Stage 1 LPC Blade Assemblies

NOTE: See Figure 301 for part/assembly removal procedure sequence.

A. Prerequisites

(1) Remove compressor inlet cone. See Removal-02 (Task 72-00-31-020-001).

B. Equipment And Materials Necessary

Special Tools:

PWA 85035	Fixture, Support
PWA 102828	Mechanical Compressor (Fan Blade Lock)

C. Procedure

NOTE: Following procedure provides for removal of blades for selective replacement purposes. See Removal-04 (Task 72-00-31-020-002-002) for removal of blades as a complete set.

WARNING: TO AVOID POSSIBLE INJURY TO HANDS GLOVES SHOULD BE WORN WHEN HANDLING FAN BLADES.

CAUTION: DO NOT LEAVE ENGINE UNATTENDED WITHOUT BLADE LOCK INSTALLED. IF ENGINE WINDMILLS WITH FAN BLADES IN FORWARD POSITION BLADES COULD BE DAMAGED.

(1) Remove compressor blade (Stage 1) lock using small pin punch in hole located near lock joint or PWA 102828 Mechanical Compressor. See Figure 302.

(2) Install PWA 85035Fixture to hub and secure with six fasteners equally spaced around hub.

CAUTION: WHEN REMOVING FAN BLADE(S), USE CARE TO AVOID DAMAGE TO RUBBER SEAL BONDED TO BOTTOM OF FAN BLADE PLATFORM.

(3) To prevent fan blade shroud and root binding during blade removal, proceed as follows:

(a) Position each fan blade at 12 o'clock position.

(b) Working in a counterclockwise direction (as viewed from front), carefully pull each blade forward, in hub slot, in small increments.

(c) Continue sliding all blades forward, one at a time, at 12 o'clock position, until stopped by fixture.

(d) Blade at 12 o'clock position should then be free to slide completely out of slot.

(e) Rotate cut−out in fixture to line up with blade to be removed at 12 o'clock position. See Figure 303 and Figure 304.

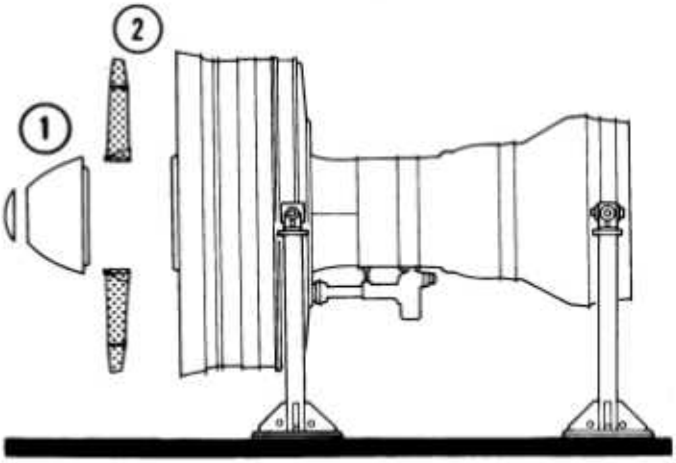
(4) Remove selected blade.

(5) If replacing matched moment weighed blade set:

(a) Turn rotor 180 degrees.

(b) Rotate ring assembly until cut−out in ring lines up with blade to be removed.

(c) Remove blade located 180 degrees from previously removed blade.



1. REMOVE COMPRESSOR INLET CONE.
2. REMOVE STAGE 1 LPC BLADE ASSEMBLIES.

ENGINE GENERAL - LOW PRESSURE COMPRESSOR (LPC) - REMOVAL-04

Task 72-00-31-020-002-002:

1. Remove All Stage 1 LPC Blade Assemblies

NOTE: See Figure 301 for part/assembly removal procedure sequence.

A. Prerequisites

(1) Remove compressor inlet cone. See Removal-02 (Task 72-00-31-020-001).

B. Equipment And Materials Necessary

Special Tools

PWA 85035	Fixture, Support
PWA 86651	Cart, Storage
PWA 102828	Mechanical Compressor (Fan Blade Lock) (Optional)

Consumable Materials:

Item No.	Designation
P05-045	Pen, Marker

C. Procedure

NOTE: Following procedure provides for removal of blades as a complete set. For selective blade replacement requirements, see Removal-03 (Task 72-00-31-020-002-001).

WARNING: TO AVOID POSSIBLE INJURY TO HANDS GLOVES SHOULD BE WORN WHEN HANDLING FAN BLADES.

CAUTION: DO NOT LEAVE ENGINE UNATTENDED. IF ENGINE WINDMILLS WITH BLADES IN FORWARD POSITION BLADES COULD BE DAMAGED.

(1) Remove compressor blade (Stage 1) lock assembly using small pin punch in hole near lock joint or PWA 102828 Mechanical Compressor. See Figure 302.

(2) Install PWA 85035 Fixture to hub and secure with work bolts or inlet cone bolts. Rotate ring assembly until cut-out in ring lines up with blade to be removed at 12 o'clock location. See Figure 303.

(3) Progressing in clockwise direction (as viewed from front), number blades 1 to 38 using temporary white Marker P05−045, or equivalent.

(4) Mark corresponding hub slots with matching blade numbers.

NOTE: Marking requirement is waived if rotor assembly is scheduled to be balanced.

CAUTION: WHEN REMOVING FAN BLADE(S), USE CARE TO AVOID DAMAGE TO RUBBER SEAL BONDED TO BOTTOM OF FAN BLADE PLATFORM.

(5) To prevent fan blade shroud and root binding during blade removal, proceed as follows:

(a) Position each fan blade at 12 o'clock position.

(b) Working in a counterclockwise direction (as viewed from front), carefully pull each blade forward, in hub slot, in small increments.

(c) Continue sliding all blades forward, one at a time, at 12 o'clock position, until stopped by fixture.

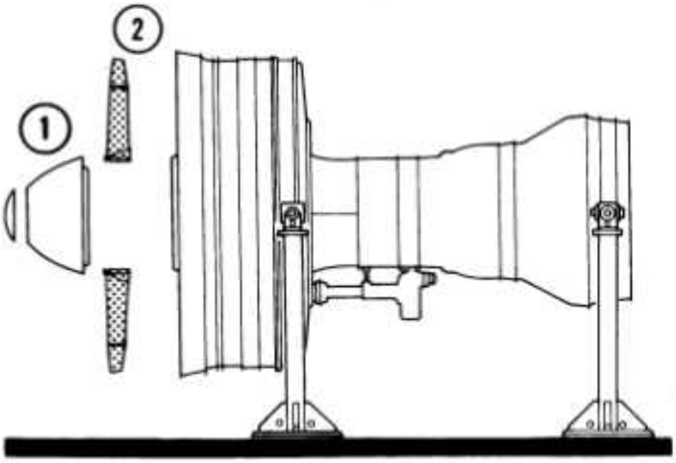
(d) Blade at 12 o'clock position should then be free to slide completely out of slot.

(e) Rotate cut−out in fixture to line up with blade to be removed at 12 o'clock position. See Figure 304.

(6) Install removed blades in PWA 86651 Cart.

(7) Remove fixture from hub.

(8) If the ribs of the duct segment assemblies in the fan case are badly worn or if the wear is not equal, examine the duct segment assemblies for wear. Refer to 72−33−01, Inspection/Check−04 in the PW4000 Series CIR, PN 51A357. See Figure 305.



1. REMOVE COMPRESSOR INLET CONE.
2. REMOVE STAGE 1 LPC BLADE ASSEMBLIES.

ENGINE GENERAL − LOW PRESSURE COMPRESSOR (LPC) − REMOVAL−05

Task 72−00−31−020−004:

1. Remove LPC Stage 1 Compressor Stator Assembly

A. Prerequisites

(1) Remove all Stage 1 LPC blade assemblies. See Removal−04 (Task 72−00−31−020−001).

B. Equipment And Materials Necessary − None

C. Procedure
See Figure 301.

(1) Remove 36 screws that attach the fan exit fairing
R (splitter). If necessary you can use one of the
R penetrating oils specified in SPOP 427 to help remove
R the screws. See Standard Practices Manual, PN 585005
R PN 585005.

R (2) Remove fairing from the engine.

R (3) Remove 50 nuts, washers and bolts securing LPC Stage 1 compressor stator assembly to LPC (Stage 1.6, 2 and 3) compressor stator assembly. Remove stator assembly from engine.

ENGINE GENERAL - LOW PRESSURE COMPRESSOR (LPC) - REMOVAL-06

Task 72-00-31-030-001:

1. Remove The No. 1 Bearing And Seal Assembly

A. Prerequisites

(1) Remove The Low Pressure Compressor (LPC). Refer to 72-00-31, Removal-01 (Task 72-00-31-020-003).

B. Equipment And Materials Necessary

Special Tools:

PWA 25000	Wrench, Hydraulic
PWA 28657	Sling
PWA 28668	Pump, Hydraulic (Electric) (Use With Hydraulic Wrench)
PWA 28669	Cart, Storage (Optional) (Use With Hydraulic Wrench)
PWA 29389	Hydraulic Pump
PWA 29510	Pump, Hydraulic (Hand) (Use With Hydraulic Wrench)
PWA 29614	Wrench, Mechanical
PWA 29615	Holder, Plate (Use With Mechanical Wrench)
PWA 45419	Air Torque Multiplier (Use With Mechanical Wrench)
PWA 76154	Adapter, Lift And Trunnion (2 Necessary)
PWA 80651	Multiplier, Pneumatic (Use With Mechanical Wrench)
PWA 85200	Puller
PWA 85201	Puller
PWA 85520	Fixture, Install And Remove
PWA 85590	Protector, Plastic
PWA 85641	Wrench, Torque (Use With Hydraulic Wrench)
PWA 85653	Wrench, Torque (Use With Mechanical Wrench)
PWA 85791	Adapter, Counter-Torque
PWA 85792	Adapter, Handling (Use With Hydraulic Wrench)
PWA 85793	Adapter, Handling (Use With Mechanical Wrench)
PWA 102125	Drift, Removal

C. Procedure

(1) Install the PWA 85520 Fixture onto the axial compressor rotor assembly located in the Stand (PWA 85660).

(2) Install the PWA 85791 Adapter into the hub ID and attach with the detail nut.

(3) Attach hoist to the PWA 28657 Sling with two PWA 76154 Adapters to the spools on the fixture. Use the spools marked for fixture LPC. Trunnion the axial compressor rotor assembly to the rear end up and place on the work area.

(4) Remove the sling and adapters from the fixture.

(5) Remove the rivets that hold the No. 1 bearing retaining nut to the hub assembly as follows:

  (a) Install PWA 102125 Removal Drift into the inside diameter of the rear end of the fan hub.

  (b) Align the drift so that the detail shear block is over one of the two rivets that hold the nut in position on the fan hub.

  (c) Turn the two detail swivel screws until they are tight. This will push the drift tight against the fan hub inside diameter where the detail shear block is located.

  (d) Adjust the three clamps assemblies to lock the drift to the fan hub. Use a wrench and turn the detail large hex head cap screw. This will move the detail shear block which will remove the head of the rivet.

  (e) Use a fabricated drift and remove the rivet shank from the fan hub.

  (f) Do the above steps again to remove the other rivet from the fan hub.

  (g) Remove the removal drift from the fan hub.

(6) For operators that use the mechanical wrench, loosen the nut on the hub as follows.

  NOTE: See the following step to remove loosen the nut with the optional Hydraulic Wrench.

  (a) Install the detail adapter of the PWA 85793 Torque Adapter onto the Adapter (PWA 85791).

  (b) Install the PWA 85653 Wrench over the adapter and onto the nut.

(c) Use the PWA 29614 Wrench, PWA 29615 Holder, and either the PWA 45419 or PWA 80651 Multiplier, to loosen the nut on the hub.

(d) Remove the tooling and nut from the hub.

(7) For operators that use the hydraulic wrench, loosen the nut on the hub as follows.

(a) Install PWA 85792 Adapter onto Adapter (PWA 85791).

(b) Install PWA 85641 Wrench on nut.

(c) Remove PWA 25000 Wrench from PWA 28669 Cart and install on wrench and adapter.

(d) Using PWA 28668 or PWA 29510 Pump actuate wrench to loosen nut on hub.

(e) Remove tooling and nut from hub.

(8) Install the PWA 85200 Puller to the inner race puller groove. Attach the PWA 29389 Pump and remove the upper half of the inner race. Remove the tooling and inner race half.

(9) Remove three screws that attach the No. 1 bearing seal assembly to the No. 1 bearing outer race flange. Carefully lower the seal assembly to rest on the hub flange. Remove the No. 1 bearing outer race and balls from the hub.

(10) Install the PWA 85201 Puller to the inner race front half (front side). Attach the PWA 29389 Pump and remove the front half of the inner race. Remove the tooling and front inner race.

(11) Remove the seal seat from the hub. Remove the No. 1 bearing seal assembly from the hub. Install the PWA 85590 Protector over the hub.

(12) Protect the carbon seal, seal seat and bearing with a protective wrapper.

ENGINE GENERAL − LOW PRESSURE COMPRESSOR (LPC) − REMOVAL−07

Task 72−00−31−030−001−002:

1. Remove The No. 1 Bearing And Seal Assembly (Hydraulic Method) − Deleted

A. Procedure

(1) This procedure is relocated to 72−00−31, Removal−06 (Task 72−00−31−030−001).

Previous Pageblock   Return to Previous Menu   Next Pageblock

Task 72-00-31-420-003:

1. Install Low Pressure Compressor (LPC)

NOTE: See Figure 401 for part/assembly installation procedure sequence.

A. Prerequisites

(1) Vacuum check No. 1 bearing compartment per Inspection/ Check-03 Task 72-00-31-990-003.

(2) See Inspection/Check-01 Task 72-00-31-990-001 for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Necessary

Special Tools:

PWA 28657	Sling
PWA 76154	Adapter, Lift And Trunnion (2 Necessary)
PWA 85292	Adapter, Torque (Optional To PWA 86227)
PWA 85483	Plate, Gaging
PWA 85520	Fixture, Install And Remove
PWA 85521	Arm, Lifting
PWA 85861	Bolt, Alignment (6 Required)
PWA 86227	Adapter, Torque
PWA 87515	Locator
PWA 102787	Fixture, Alignment

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-045	Pen, Marker
P06-002	Petrolatum White (PMC 9609)
R P06-054	Anti-Seize Compound (PWA 36246)
P09-014	Sealant, Silicone Rubber (PWA 36003)

Expendable Parts:

		PARTS CATALOG REFERENCE
PART NAME	QUANTITY	SECTION/FIGURE/ITEM
Packing	1	72-00-31/2/1
Packing	1	72-31-00/6/370

C. Procedure
See Figure 402.

(1) Make a mark on the LPC case and the fan exit case to help align the two cases during assembly as follows:

(a) Locate the LPC engine identification tag attached to the LPC case at the 10:30 o'clock position.

(b) Place the PWA 87515 Locator on the LPC case at the 9:00 o'clock position of the flange which attaches to the fan exit case. Make sure the locator dowel pins are installed and the slot is over the case split line.

(c) Make a mark with a Pen Marker P05−045 on the flange at each "V" groove. Remove the locator from the LPC case.

(d) Place the Locator (PWA 87515) on the fan exit case at the 9:00 o'clock position of the flange which the LPC case is attached. Make sure the four locator dowel pins are installed in the flange.

(e) Make a mark with a Pen Marker P05−045 on the flange at each "V" groove. Remove the locator from the fan exit case.

(2) Attach PWA 85521 Arm to PWA 85520 Fixture using six shoulder screws and washers. Attach hoist to outer hole on arm and raise fixture.

WARNING: USE SPOOLS ON PWA 85520 FIXTURE MARKED "LIFT FIXTURE AND LPC MODULE ONLY" WHEN TRUNNIONING LPC MODULE. FAILURE TO USE CORRECT SPOOLS COULD RESULT IN INJURY TO PERSONNEL AND/OR PARTS.

(3) Attach hoist to PWA 28657 Sling with two PWA 76154 Adapters to spools on fixture. Use spools marked for fixture and LPC. Trunnion fixture to horizontal for assembly to LPC.

NOTE: LPC may already be stored in fixture on bench, pallet or floor.

(4) Install fixture to LPC.

(a) Locate identification bracket attached to first stage stator shroud approximately 10 o'clock viewed from front. Moving counterclockwise (CCW) find split in case (approximately 9 o'clock). Count CCW 14 holes. This is approximately 6 o'clock position.

(b) Lower fixture to LPC. Using detail−21 dowel pin, position V−groove locator, detail−5, against bolt head determined in above. First stage stator is now timed to engine. Using two detail−16 handles rotate to lock fingers in position.

(c) Secure fixture to hub with 19 bolts and to stator with clamps.

(d) Raise LPC and trunnion to horizontal position.

(5) Install packing around groove in 4th stage stator support. Overlap ends and cut packing diagonally using sharp blade. Secure butt ends with Silicone Rubber P09−014. Apply Petrolatum White P06−002 to packing.

(6) Install packing, lubricated with Engine Oil P03−001, to groove in No. 1 bearing carbon seal support.

(7) (Post PW4ENG−72−660) Install the PWA 102787 Alignment Fixture to the front lip of the inner fan exit case assembly and attach with the six detail bolts.

CAUTION: DO NOT SEAT THE LPC TO THE NO. 1 BEARING SUPPORT WITH THE PWA 85861 ALIGNMENT BOLTS, AS DAMAGE WILL OCCUR TO THE NO. 1 BEARING SEAL SUPPORT IN THIS LPC.

(8) Position LPC on the engine approximately 0.250 inch (6.350 mm) from engagement with the No. 1 bearing front support. Make sure the offset holes, at approximately 7 o'clock viewed front, are aligned. Also, the pen marks made before on the cases can be used to help align the cases.

CAUTION: BEFORE BOLTS ARE TIGHTENED, CHECK WITH MIRROR THROUGH THE 2.5 BLEED PORT AT 7:30 (VIEWED FROM REAR) TO MAKE SURE THE 2.5 BLEED ROD IS IN LINE WITH SCALLOPED CLEARANCE CUT IN THE

LPC OUTER CASE OR DAMAGE CAN OCCUR TO LPC STATOR.

(9) Install six PWA 85861 Alignment Bolts, one in offset hole and the others equally spaced from the back side of the No. 1 bearing support into the correct holes of the LPC. Be sure to engage all six alignment bolts approximately 5 − 6 turns each. Tighten bolts in an alternating procedure to draw the LPC into the No. 1 bearing support only to the point of engagement.

(10) Install four bolts, threads lubricated with Engine Oil P03−001 equally spaced in No. 1 bearing front support. Install eight bolts, threads lubricated with Engine Oil P03−001, with washers, equally spaced in LPC compressor stator assembly bolt circle. Tighten to secure LPC.

(11) Remove alignment bolts from No. 1 bearing support. Remove fixture from LPC.

(12) (Post PW4ENG−72−660) Loosen and remove the six detail bolts that attach the alignment fixture to the front lip of the inner fan exit case assembly and remove the fixture.

(13) Apply Engine Oil P03−001 to the threads of 36 front support bolts.

(a) If applicable, attach the No. 1 bearing vibration transducer to the front support in the two offset holes at 4:30 o'clock with two washers and two of the bolts. See Figure 403.

(b) Install the remaining bolts in the front support.

(c) Install 42 bolts, threads lubricated with Engine Oil P03−001 with washers into LPC compressor stator assembly flange.

(d) Torque both sets of bolts simultaneously.

(14) Torque No. 1 bearing support bolts to 180 − 200 lb−in. (20.337 − 22.597 N.m) with PWA 86227 or PWA 85292 Adapter. Torque LPC compressor stator assembly bolts 36 − 40 lb−in. (4.067 − 4.519 N.m). Using opposite bolt pattern torque bolts to minimum torque. Then retorque bolts within specified limit.

(15) Install fan exit fairing (splitter) to the engine as follows:

(a) Loosely install the fairing on the LPC, visually align the holes in the fairing with the holes in the LPC.

(b) Lubricate the threads of 36 screws with Anti−Seize Compound P06−054.

(c) Install the fairing with the 36 lubricated screws.

(d) Tighten and torque the screws to 27 − 30 lb−in. (3.051 − 3.390 N.m).

(e) Wipe off any excess anti−seize compound.

(16) If LPC or LPC/LPT coupling or No. 1 bearing and seal assembly or No. 1 bearing support assembly is installed due to replacement or repair then LPT running position spacer must be removed and spacer thickness calculated as follows:

(a) Position PWA 85483 Gaging Plate on shoulder inside front compressor front hub and secure.

(b) Measure and record distance from front face of plate to front face on LPT shaft that spacer locates on.

(c) Measure and record distance from shoulder on turbine shaft coupling which locates on front hub to shoulder that contacts LPT running position spacer.

(d) Spacer thickness is determined by measured distance from gaging plate to LPT shaft minus dimension stamped on plate minus dimension measured on turbine shaft coupling.

D. Postrequisites

(1) Install The LPC/LPT Coupling. Refer to 72−00−32, Installation−01 (Task 72−00−32−420−001).

(2) Install All Stage 1 LPC Blade Assemblies. Refer to 72−00−31, Installation−04 (Task 72−00−31−420−002−002).

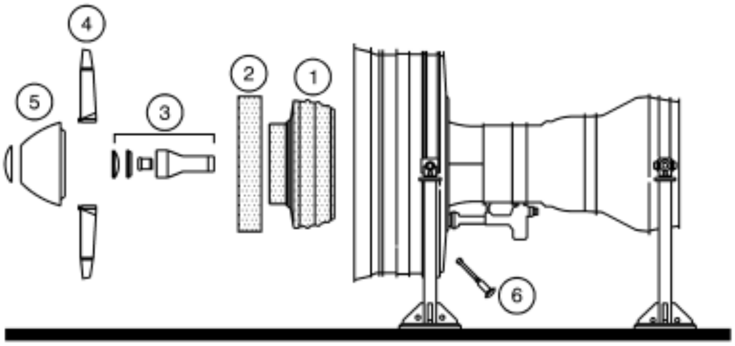
ENGINE GENERAL − LOW PRESSURE COMPRESSOR (LPC) − INSTALLATION−01

(3) Install The Compressor Inlet Cone. Refer to 72−00−31, Installation−02 (Task 72−00−31−420−001).

(4) Install The Electronic Engine Control (EEC) Speed, Transducer (N1). Refer to 72−00−34, Installation−03 (Task 72−00−34−450−001).

(5) Test the engine per the Test Reference Table. Refer to 71−00−00, Testing−00 (Task 71−00−00−990−003).

ENGINE GENERAL − LOW PRESSURE COMPRESSOR (LPC) − INSTALLATION−01



1. INSTALL LOW PRESSURE COMPRESSOR (LPC).
2. INSTALL FAN EXIT FAIRING.
3. INSTALL LPC/LPT COUPLING.
4. INSTALL STAGE 1 LPC BLADE ASSEMBLIES.
5. INSTALL COMPRESSOR INLET CONE.
6. INSTALL ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).

ENGINE GENERAL - LOW PRESSURE COMPRESSOR (LPC) - INSTALLATION-02

Task 72-00-31-420-001:

1. Install Compressor Inlet Cone

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

B. Procedure
See Figure 401.

(1) If installed, remove any shims between the tips of the lower fan blades and the fan case rubstrip.

(2) Align marking pen mark on inlet cone (rear) segment with pen mark on front compressor hub. Install and secure cone segment to hub with 19 washers and bolts, threads lubricated with Engine Oil P03-001. Use a non-metalic blunt object (plastic scrapper or equivalent) and make sure the seal is tucked under the fan blade platform leading edge before you tighten the bolts. Tighten and torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(3) Align the pen mark on the inlet cone front segment with the pen mark on the inlet cone (rear) segment. Install and attach the cone front segment with the six washers and bolts, threads lubricated with Engine Oil P03-001.

NOTE: It is not necessary to line up any marks during installation of a NEW inlet cone or one that has been repaired and balanced. New and repaired inlet cones are balanced to within 1.0 oz-in (720.0 g.mm) and do not need to be aligned at installation.

NOTE: You must use the alignment marks when you install an inlet cone that was removed and then installed on the same engine to make sure that any operational imbalance in the inlet cone from operation is not disturbed during reinstallation.

(4) (Reference 984) Tighten and torque the bolts to 45 - 50 lb-in. (5.084 - 5.649 N.m).

Task 72-00-31-420-002-001:

1. Install Individual Or Matched Moment Weighed Set Of Stage 1 LPC Blade Assemblies

NOTE: See Figure 401 for part/assembly installation procedure sequence.

A. Prerequisites

(1) See Inspection/Check-01 (Task 72-00-31-990-001) for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Necessary

Consumable Materials:

	Item No.	Designation
R R	P06-005	Compound, Antigalling, Metal Assembly Paste (PWA 587)

C. Procedure

NOTE: Following procedure provides for installation of blades for selective replacement purposes. See Installation-04 (Task 72-00-31-420-002-002) for installation of blades as a complete set.

WARNING: TO AVOID POSSIBLE INJURY TO HANDS, GLOVES SHOULD BE WORN WHEN HANDLING FAN BLADES.

CAUTION: DO NOT LEAVE ENGINE UNATTENDED WITHOUT BLADE LOCK INSTALLED. IF ENGINE WINDMILLS WITH FAN BLADES IN FORWARD POSITION, BLADES COULD BE DAMAGED.

(1) Select blades as follows:

NOTE: Blade replacement may be accomplished using single blades selected by moment weight or by using matched set. When replacing matched set, rotor must have been previously assembled on matched set basis.

(a) When replacing a moment weight set of fan blades, installation of each blade must be 180 degrees apart. Two moment weight blades must be paired by matching like moment weights within 1.0 oz−in. (720 g.mm).

(b) When replacing one blade in a full rotor set, the replacement blade must be within 1.0 oz−in. (720 g.mm) of the 180 degree opposite moment weight blade.

R R R (c) Make a temporary mark with a marker. Refer to Section 70−11−00 in the Standard Practices Manual, PN 585005.

NOTE: Blade moment weight markings are found on concave side of blade airfoil section. See Figure 403.

(d) If two or more blended blades are grouped together, then blended blades and their matching blades should be evenly distributed around hub. Unless this process can be successfully completed a vibration check is recommended.

R R R (2) Apply Antigalling Compound P06−005 to the mid−span shrouds and blade roots of the blades by the procedure that follows:

R R R WARNING: DO NOT LET THE ANTIGALLING COMPOUND P06−005 TO TOUCH YOUR SKIN. IF IT DOES, WASH IMMEDIATELY WITH SOAP AND WATER.

R R R (a) Apply Antigalling Compound P06−005 to the touch faces of the mid−span shrouds of the blades. Use a brush application procedure.

R R R R R R R (b) Apply Antigalling Compound P06−005 to the dovetail area of the fan blade root. Do not apply antigalling compound to the fan hub slots or bottom face of the fan blade root. Some antigalling compound is permitted on the area between the dovetail area and platform. See Figure 404.

(3) Position rotor (with support fixture in place) to locate empty blade slot at 12 o'clock position.

(4) Ensure that blades are positioned forward in slots until stopped by fixture.

CAUTION: WHEN INSTALLING FAN BLADE(S), USE CARE TO AVOID DAMAGE TO RUBBER SEAL BONDED TO BOTTOM OF FAN BLADE PLATFORM.

(5) To prevent fan blade shroud and root binding during blade installation, proceed as follows:

(a) Install replacement blade.

(b) Position each fan blade at 12 o'clock position.

(c) Working in a clockwise direction (as viewed from front), carefully push each blade rearward, into hub slot in small increments.

(d) Continue sliding all blades rearward, one at a time, at 12 o'clock position, until seated. See Figure 402.

(6) If replacing matched moment weighed set:

(a) Turn rotor 180 degrees to position empty blade slot at 12 o'clock position.

(b) Reposition fixture slot and repeat blade installation procedure.

(7) Remove Fixture PWA 85035 from hub flange. Install compressor blade (Stage 1) lock assembly. See Figure 403.

(a) Position lock to align anti-rotation pin of lock with anti-rotation slot of hub.

(b) Install lock starting at lock joint.

(c) Seat lock using fiber drift.

(d) (Reference 761) Make sure the lock is correctly installed by measurement of the gap between the lock ends. The gap must be 0.010 - 0.060 inch (0.25 - 1.52 mm). If you can not get the correct gap measurement, you must make sure the lock is fully seated.

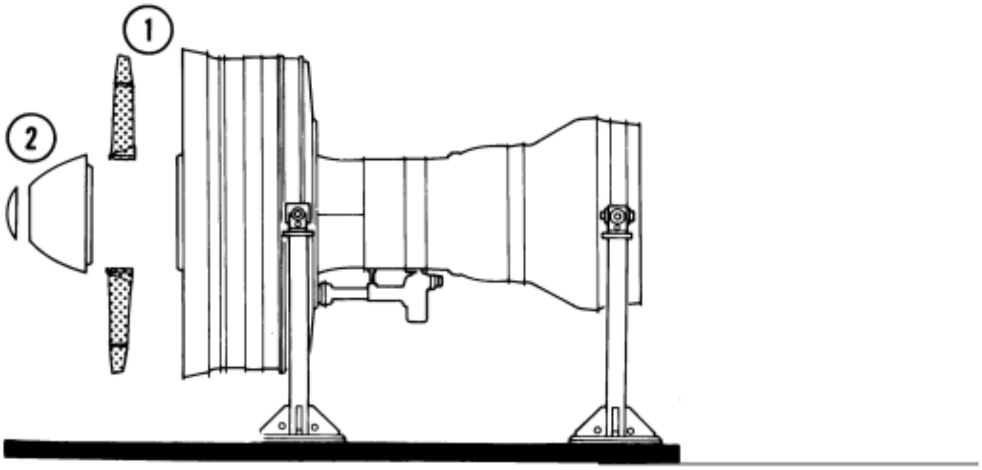
D. Postrequisites

ENGINE GENERAL - LOW PRESSURE COMPRESSOR (LPC) - INSTALLATION-03

(1) Install compressor inlet cone. See 72-00-31, Installation-02 (Task 72-00-31-420-001).

(2) Test engine per Repair Test Reference Table. See 71-00-00, Testing-00 (Task 71-00-00-990-003).

ENGINE GENERAL − LOW PRESSURE COMPRESSOR (LPC) − INSTALLATION−03



1. INSTALL STAGE 1 LPC BLADE ASSEMBLIES.
2. INSTALL COMPRESSOR INLET CONE.

Task 72-00-31-420-002-002:

1. Install All Stage 1 LPC Blade Assemblies

NOTE: See Figure 401 for part/assembly installation procedure sequence.

A. Prerequisites

(1) See Inspection/Check-01 Task 72-00-31-990-001 for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Necessary

Special Tools:

PWA 85035	Fixture, Support
PWA 86651	Cart, Storage

Consumable Materials:

	Item No.	Designation
R	P06-005	Compound, Antigalling, Metal Assembly Paste
R		(PWA 587)

C. Procedure

NOTE: Following procedure provides for installation of all blades as a complete set. See Installation-03 (Task 72-00-31-420-002-001) for installation of blades for selective replacement.

WARNING: TO AVOID POSSIBLE INJURY TO HANDS, GLOVES SHOULD BE WORN WHEN HANDLING FAN BLADES.

CAUTION: DO NOT LEAVE ENGINE UNATTENDED WITHOUT BLADE LOCK INSTALLED. IF ENGINE WINDMILLS WITH FAN BLADES IN FORWARD POSITION, BLADES COULD BE DAMAGED.

(1) Install PWA 85035 Support Fixture to hub and secure with work bolts or inlet cone bolts.

(2) Remove blades from PWA 86651 Cart and arrange in order, as previously numbered, or lay out blades in moment weighed sets. If necessary, number blades, with heaviest pair as 1 and 20, next heaviest as 2 and 21, next heaviest as 3 and 22, continuing to lightest matched set, 19 and 38. Make a temporary mark with a marker. Refer to Section 70-11-00 in the Standard Practices Manual, PN 585005.

NOTE: Blade moment weight markings are located on concave side of blade airfoil section. See Figure 402.

(3) Apply Antigalling Compound P06-005 to the mid-span shrouds and blade roots of the blades by the procedure that follows:

WARNING: DO NOT LET THE ANTIGALLING COMPOUND P06-005 TO TOUCH YOUR SKIN. IF IT DOES, WASH IMMEDIATELY WITH SOAP AND WATER.

(a) Apply Antigalling Compound P06-005 to the touch faces of the mid-span shrouds of the blades. Use a brush application procedure.

(b) Apply Antigalling Compound P06-005 to the dovetail area of the fan blade root. Do not apply antigalling compound to the fan hub slots or bottom face of the fan blade root. Some antigalling compound is permitted on the area between the dovetail area and platform. See Figure 404.

CAUTION: WHEN INSTALLING FAN BLADE(S), USE CARE TO AVOID DAMAGE TO RUBBER SEAL BONDED TO BOTTOM OF FAN BLADE PLATFORM.

(4) Working in counter-clockwise (hub rotation) direction (6 o'clock position as viewed from front), install blades in numerical order in matching numbered blade slots, until last blade is ready for installation.

(5) Turn rotor to locate remaining open blade slot at 12 o'clock position and install last blade.

(6) To prevent fan blade shroud and root binding during blade installation, proceed as follows:

(a) Position each fan blade at 12 o'clock position.

(b) Working in a clockwise direction (as viewed from front), carefully push each blade rearward, into hub slot in small increments.

(c) Continue sliding all blades rearward, one at a time, at 12 o'clock position, until seated.

(7) Remove fixture from hub.

(8) Install blade (Stage 1) lock assembly into slot in hub and blades. See Figure 403.

(a) Position lock to align anti-rotation pin of lock with anti-rotation slot of hub.

(b) Install lock, starting at lock joint.

(c) Seat lock using fiber drift.

(d) (Reference 761) Make sure the lock is correctly installed by measurement of the gap between the lock ends. The gap must be 0.010 - 0.060 inch (0.25 - 1.52 mm). If you can not get the correct gap measurement, you must make sure the lock is fully seated.

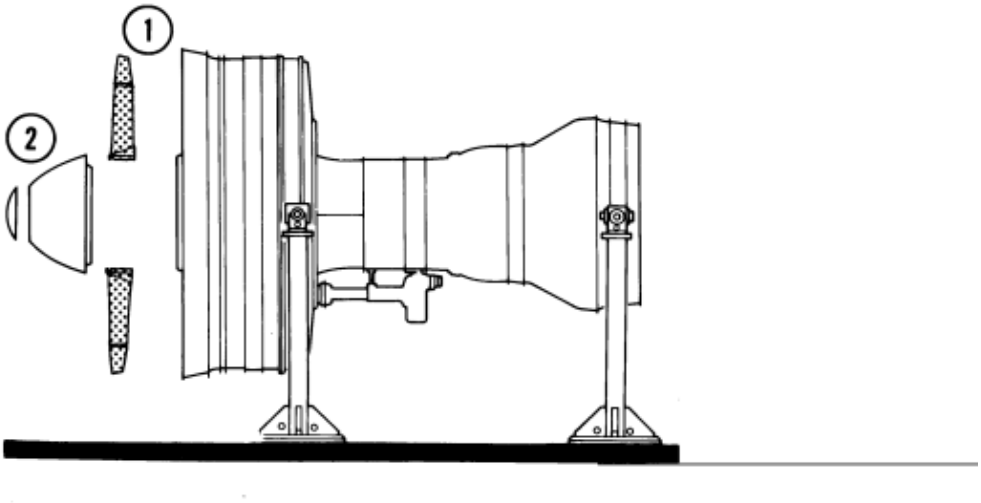
(9) If the turbine shaft coupling assembly is not installed, install six shims between the lower fan blade tips and the fan case rubstrip. The shims support the LPC rotor.

D. Postrequisites

(1) Install compressor inlet cone. See Installation-02 (Task 72-00-31-420-001).

(2) Test engine per Repair Test Reference Table. See 71-00-00, Testing-00 (Task 71-00-00-990-003).

ENGINE GENERAL − LOW PRESSURE COMPRESSOR (LPC) − INSTALLATION−04



1. INSTALL STAGE 1 LPC BLADE ASSEMBLIES.
2. INSTALL COMPRESSOR INLET CONE.

Task 72-00-31-420-004:

1. Install LPC Stage 1 Compressor Stator Assembly

A. Equipment And Materials Necessary

Consumable Materials:

	Item No.	Designation
R	P03-001	Engine Oil
R	P06-054	Anti-Seize Compound (PWA 36246)

B. Procedure
See Figure 401.

(1) Install LPC Stage 1 compressor stator assembly aligning offset holes in stator flange with offset holes in Stage 1.6 stator located at approximately 3 and 9 o'clock locations. Install 50 bolts, threads lubricated with Engine Oil P03-001, 100 washers and 50 nuts. With bolt heads forward, tighten and torque nuts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(2) Install the fan exit fairing (splitter) to the engine as follows:

(a) Loosely install the fairing on the LPC, visually align the holes in the fairing with the holes in the LPC.

(b) Lubricate the threads of 36 screws with Anti-Seize Compound P06-054.

(c) Install the fairing with the 36 lubricated screws.

(d) Tighten and torque the screws to 27 - 30 lb-in. (3.051 - 3.390 N.m).

(e) Wipe off any excess anti-seize compound.

C. Postrequisites

(1) Install all (Stage 1) LPC blade assemblies. See Installation-04 (Task 72-00-31-420-002-002).

(Task 72−00−31−420−004)

Task 72-00-31-430-002:

1. Install The No. 1 Bearing And Seal Assembly

A. Prerequisites

(1) Assemble The Axial Compressor Rotor Assembly. Refer to 72-31-01, Assembly-01 (Task 72-31-01-440-001).

(2) Assemble The No. 1 Bearing (Carbon) Seal Assembly. Refer to 72-31-17, Assembly-01 (Task 72-31-17-440-001).

(3) Vacuum Check The No. 1 Bearing Compartment. Refer to 72-00-31, Inspection/Check-03 (Task 72-00-31-990-003).

(4) See 72-31-00, Inspection/Check-04 (Task 72-31-00-990-001) for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Necessary

Special Tools:

PWA 25000	Wrench, Hydraulic
PWA 26523	Riveter (Optional To PWA 86338)
PWA 28657	Sling
PWA 28668	Pump, Hydraulic (Electric) (Use With Hydraulic Wrench)
PWA 28669	Cart, Storage (Optional) (Use With Hydraulic Wrench)
PWA 29510	Pump, Hydraulic (Hand) (Use With Hydraulic Wrench)
PWA 29614	Wrench, Mechanical
PWA 29615	Holder
PWA 45419	Air Torque Multiplier (Use With Mechanical Wrench)
PWA 75046	Cart (Optional) (Use With Hydraulic Wrench)
PWA 76154	Adapter, Lift And Trunnion (2 Necessary)
PWA 80651	Multiplier, Pneumatic (Use With Mechanical Wrench)
PWA 85178	Gage, Assembly
PWA 85186	Drift
PWA 85520	Fixture, Install And Remove
PWA 85524	Ring, Alignment
PWA 85584	Protector, Plastic
PWA 85653	Wrench, Torque
PWA 85654	Adapter, Handling
PWA 85791	Adapter, Counter-Torque

Special Tools:

(CONTINUED)

PWA 85793	Adapter, Holding
PWA 86338	Riveter

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)
P05−045	Pen, Marker (PMC 4092)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Rivet	2	72−31−00/7/200

C. Procedure

NOTE: The LPC is front end up in PWA 85660 Stand.

(1) Trunnion the LPC from front end up to rear end up as follows. See Figure 401.

(a) Install PWA 85791 Adapter in the ID of the front compressor hub assembly (called hub). Attach the adapter with the detail nut.

(b) Install PWA 85520 Fixture on the LPC.

(c) Lift PWA 28657 Sling with a hoist. Install two PWA 76154 Adapters on the sling. Install the adapters on the spools of the fixture. Use the spools marked "LPC Module Only".

(d) Trunnion the LPC to rear end up.

(e) Remove the sling and adapters from the fixture.

(2) (Reference 460) Measure Dimension F as follows (Method 1). See Figure 402.

NOTE: To measure Dimension F, use either this method or Method 2.

(a) Install the No. 1 bearing seal seat (called seal seat), the bearing inner races, and the No. 1 bearing (inner race) retaining nut (called nut), lubricated with Engine Oil P03−001, on PWA 85178 Gage. The diametral empty space between the gage and the stacked parts must be 0.001 − 0.005 inch (0.026 − 0.127 mm).

(b) For operators that use the mechanical wrench, install PWA 85654 Adapter on the gage. Install PWA 85653 Wrench in the nut. Install PWA 29614 Wrench on PWA 85653 Wrench. Install PWA 29615 Holder. Tighten and torque the nut to 33,600 − 37,200 lb−in. (3796.289 − 4203.035 N.m). There must be zero clearance between all mating parts.

(c) For operators that use the hydraulic wrench, attach PWA 85792 Adapter to the gage. Install PWA 85641 Wrench on the nut. Remove PWA 25000 Wrench from the PWA 28669 Cart and install it on the PWA 85641 Wrench. With a PWA 28668 or PWA 29510 Pump, tighten and torque the nut to 33,600 − 37,200 lb−in. (3796.289 − 4203.035 N.m). There must be zero clearance between all mating parts.

R (d) Put the detail−8 bar and dial indicator of the gage on top of the nut. Move the dial indicator off the detail−16 flush pin to set the indicator on zero.

(e) Move the dial indicator on the flush pin. Read the measurement (Dimension M). Write the measurement. Do this measurement at several positions. Calculate the average value of Dimension M. Add this value to the basic gage size
R stamped on the detail−8 bar (Dimension X). Call this sum Dimension F.

$$F = X + \text{Average } M$$

(f) Remove the engine parts from the gage.

(3) (Reference 460) Measure Dimension F as follows (Method 2).

NOTE: To measure Dimension F, use either this method or Method 1.

(a) Measure the thickness of each of the parts that follow. Do the measurements at four positions that are at the same distance from each other. Write the measurements.

1 The seal seat (Dimension K)

2 The inner races (Dimensions N and P)

3 The nut (Dimension Q).

(b) Add together the maximum thicknesses from each part. Call this sum Dimension F.

F = Maximum K + Maximum N + Maximum P + Maximum Q

(4) (Reference 460) Measure Dimension B as follows. See Figure 403.

(a) Measure the dimension from the rear (top) face of the fan hub to the shoulder of the hub. Use the detail−8 bar, detail−21 flush pin, and detail dial indicator of PWA 85178 Gage. Call this Dimension Y.

NOTE: It is permitted to use standard shop equipment to measure Dimension B.

(b) Add Dimension Y to the basic gage size stamped on the detail−8 bar (Dimension X) if the flush pin is below the top of the bar. Subtract Dimension Y from Dimension X if the flush pin is above the top of the bar. Call this Dimension B.

B = X + Y OR B = X − Y

NOTE: This equation does not apply if you do not use the gage.

(5) Install the No. 1 bearing (carbon) seal assembly on the hub as follows. See Figure 404.

(6) Install the seal seat on the hub. The flat face marked FRONT must be face down.

(7) Install the No. 1 ball bearing on the hub as follows.

(a) Heat the inner races. See Standard Practices Manual, PN 585005.

R
R

(b) With correct gloves on your hands, remove the front half of the inner race (without the puller groove). Install the inner race on the hub. Use PWA 85186 Drift.

(c) Install the outer race on the hub.

(d) Lift the outer race to put it a little above the inner race. Install the bearing balls and cage in the outer race. Lower the outer race.

(e) With correct gloves on your hands, remove the rear half of the inner race from the heat source. Hold the inner race with the puller groove up. Align the X marks on the front and rear inner races. Install the inner race on the hub. Use PWA 85186 Drift.

CAUTION: IF THE NUT YOU INSTALL IS NOT NEW, YOU MUST PUT NEW SILVER PLATE ON IT BEFORE YOU INSTALL IT. IF YOU DO NOT, IT WILL CAUSE DAMAGE TO THE MATING PARTS. TO PLATE THE NUT, REFER TO PW4000 SERIES CIR, PN 51A357.

(8) For operators that use the mechanical wrench, install the nut on the hub as follows. See Figure 405.

(a) Install the nut, threads lubricated with Engine Oil P03−001, on the hub.

(b) Install the PWA 85793 Adapter on the PWA 85791 Adapter.

(c) Install the PWA 85653 Torque Wrench on the adapter.

(d) With a hoist, lift the PWA 29614 Mechanical Wrench.

(e) Install the mechanical wrench and PWA 29615 Holder on the adapter.

(f) Install either the PWA 45419 Multiplier or the PWA 80651 Multiplier on the wrench.

(g) Tighten the nut with the PWA 29614 Wrench in the following step.

CAUTION: IF THE NUT YOU INSTALL IS NOT NEW, YOU MUST PUT NEW SILVER PLATE ON IT BEFORE YOU INSTALL IT. IF YOU DO NOT, IT WILL CAUSE DAMAGE TO THE MATING PARTS. TO PLATE THE NUT, REFER TO PW4000 SERIES CIR, PN 51A357.

(9) For operators that use the hydraulic wrench, install the nut on the hub as follows. See Figure 406.

- (a) Install the nut, threads lubricated with Engine Oil P03−001, on the hub.
- (b) Install the PWA 85792 Adapter on the PWA 85791 Adapter.
- (c) Install the PWA 85641 Wrench on the nut.
- (d) With a hoist, lift the PWA 25000 Hydraulic Wrench from the PWA 28669 Cart.
- (e) Install the wrench on the PWA 85792 Adapter.
- (f) Use either a PWA 28668 or PWA 29510 Pump to torque the nut in the following step.

CAUTION: IF, TO INSTALL THIS NUT, YOU MUST TORQUE THE NUT MORE THAN THREE TIMES, YOU MUST REMOVE THE NUT AND PLATE IT AGAIN BEFORE YOU TORQUE IT THE FOURTH TIME. THE MAXIMUM NUMBER OF TIMES YOU CAN TORQUE THE NUT BEFORE IT IS NECESSARY TO RE−PLATE IT IS THREE. TO PLATE THE NUT, REFER TO PW4000 SERIES CIR, PN 51A357.

(10) (Reference 460) Torque the nut as follows.

- (a) Torque the nut to 33,600 − 37,200 lb−in. (3796.289 − 4203.035 N.m). Turn the nut through an angle of 14 − 16 degrees. Loosen the nut to zero.
- (b) Torque the nut to 33,600 − 37,200 lb−in. (3796.289 − 4203.035 N.m).
- (c) Use a Marker Pen P05−045 and make a reference point mark on the nut and an adjacent part. Marks must be aligned.
- (d) Measure Dimension L as follows.

1 The temperature of all parts must be within ± 5°F (2.8°C) of room temperature when you measure the parts.

2 Set the dial indicator of PWA 85178 Gage to zero.

3 Measure the dimension from the rear (top) face of the nut to the rear (top) face of the hub (Dimension Z). Use the detail−15 bar and the detail−16 flush pin. Do the measurement several times. Calculate the value of average Dimension Z.

NOTE: It is permitted to use standard shop equipment to measure Dimension L.

4 Add Dimension Z to the basic gage size stamped on the detail bar if the flush pin is below the top of the detail bar. Subtract Dimension Z from the basic gage size stamped on the detail bar if the flush pin is above the top of the detail bar.

L = detail−15 basic gage size + Average Z OR
L = detail−15 basic gage size − Average Z

NOTE: This equation does not apply if you do not use the gage.

5 The statements that follow must be true:

L <= F − B + 0.000 inch (0.0000 mm) AND
L >= F − B − 0.001 inch (0.025 mm)

(e) Turn the nut through an angle of 14 − 16 degrees. Loosen the nut to zero.

(f) Torque the nut to 33,600 − 37,200 lb−in. (3796.289 − 4203.035 N.m).

(g) Do a check of the reference points as follows.

1 The reference point on the nut must be either aligned with the reference point on the mating part or beyond it within 1 degree 30 minutes.

2 If the reference points are within limits, turn the nut through an angle of 14 − 16 degrees. If necessary, advance 2 degrees 30 minutes, maximum, to the next locking feature.

3 If the reference points are not within limits, do steps (d), (e), and (f), in that order, until the reference points are within limits. Then do step (g).

(11) Remove from the hub the tools that you used to torque the nut.

(12) Install the rivets in the nut as follows.

(a) Install two rivets, 180 degrees apart, through the hub and the nut. The head of the rivet must be in the ID of the hub.

(b) Flare the heads of the rivets. Use PWA 86338 Riveter or PWA 26523 Riveter.

(13) Put PWA 85524 Ring over the flange of the bearing. With the detail foolproof and location pins, align the bearing with the seal assembly.

(14) Attach the bearing to the seal assembly as follows.

(a) Apply Engine Oil P03−001 to the threads of three fillister head screws.

(b) Lift the seal assembly to touch the flange of the bearing outer race.

(c) Install the three screws in the outer race. Tighten and torque the screws to 22 lb−in. (2.486 N.m) plus the torque necessary to turn the screw through the self−locking threads. The maximum torque permitted is 95 lb−in. (10.734 N.m).

(15) Remove the ring from the hub. Install PWA 85584 Protector over the bearing and seal assembly.

ENGINE GENERAL - LOW PRESSURE COMPRESSOR (LPC) - INSTALLATION-07

Task 72-00-31-430-001-002:

1. Install The No. 1 Bearing And Seal Assembly (Hydraulic Method) - Deleted

A. Procedure

(1) This procedure is relocated to 72-00-31, Installation-06 (Task 72-00-31-430-002).

Previous Pageblock   Return to Previous Menu   Next Pageblock

Task 72-00-31-990-001:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B or C located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.

C. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits

(1) Limits applicable to any combination of new or used parts.

(a) This column provides the acceptable (minimum − maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.

(b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.

(c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (13.131) (-) 0.512 (13.005) = .005 (0.126)

0.527 (13.385) (-) 0.508 (12.903) = .019 (0.482)

EXAMPLE 2

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3. These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

F. Fits And Clearances

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
761	A	Gap, Compressor Blade (Stage 1) Lock (See Figure 801)

ENGINE GENERAL − LOW PRESSURE COMPRESSOR (LPC) − INSPECTION/CHECK−02

Task 72−00−31−990−002:

1. Eddy Current Inspect Leading And Trailing Edge Of Stage 1 LPC Blade Assembly
   - A. Equipment And Materials Required − None
   - B. Procedure
     - (1) Eddy current inspect (fan) blades per 72−31−82, Inspection/Check−02 (Task 72−31−82−200−002).

Previous Pageblock Return to Previous Menu Next Pageblock

ENGINE GENERAL - LOW PRESSURE COMPRESSOR (LPC) - INSPECTION/CHECK-03

Task 72-00-31-990-003:

1. Vacuum Check No. 1 Bearing Compartment

A. Equipment And Materials Required

Special Tools:
CTE 6075 Cart, Vacuum
PWA 85478 Adapter, Vacuum Check
PWA 85584 Protector

B. Procedure

See Figure 801.

(1) Ensure that packing is installed in OD groove of seal assembly and in OD groove of adapter.

(2) Attach hoist to eye bolt on PWA 85478 Adapter and lift to position it over hub and No. 1 bearing.

(3) Attach vacuum hose and pressure sense line from CTE 6075 Vacuum Cart and vacuum check No. 1 bearing compartment by setting the vacuum cart pressure at PAMB minus 10 psi (69 kPa), or PAMB minus 20 inches (508 mm) HG. At sea level this is 5.0 psia (34.5 kPa absolute).

  (a) (Pre SB PW4ENG 72-245) Airflow must not exceed 14 lbs. (6.36 kg) per hour.

  (b) (Post SB PW4ENG 72-245) Airflow must not exceed 5 lbs. (2.27 kg) per hour.

(4) Disconnect lines from adapter. Attach hoist to eye bolt on adapter and remove from No. 1 bearing.

(5) Install PWA 85584 Protector over No. 1 bearing assembly.

ENGINE GENERAL - LOW PRESSURE COMPRESSOR (LPC) - INSPECTION/CHECK-10

Task 72-00-31-990-010:

1. Visually Inspect The Low Pressure Compressor (LPC) Module Assembly

A. Equipment And Materials Necessary

Consumable Materials:

Item No.	Designation
P09-014	Sealant, Silicone Rubber (PWA 36003-1)

B. General Inspection Limits

NOTE: All applicable Airworthiness Directives (AD's) must be complied with these directives take precedence over all inspections or repairs given in this module inspection.

(1) This inspection does not permit time since overhaul to be set to zero.

(2) These procedures give instructions for the visual inspection of the low pressure compressor module assembly after removal from the engine. Do these procedures before you do the preservation, packing or module installation procedure. This procedure is used to find those easy to see types of damage, which can make it necessary to do more disassembly, inspection or repair. Refer to Section 70-31-00 for the general visual inspection instructions in the Standard Practices Manual, PN 585005.

(3) The inspection table in this section is applicable to the low pressure compressor modules with some, none or all of the components installed. You do not have to disassemble the module assembly to do this inspection. You can choose to apply individual limits to those areas that are visible at all stages of disassembly. If a condition shows that there can be damage that you cannot see, remove a component to fully examine the damaged area. Use the applicable procedures in this manual to remove the component and do an inspection by step (4).

(4) Remove all the components that you find not serviceable at the modular level. Send the applicable components for more inspection and repair at the component level maintenance. Refer to Section 72−31−00 in the PW4000 Series CIR, PN 51A357. Components that you remove from the low pressure compressor module, will need a Cleaning, Inspection and Repair Manual component level inspection/check.

(5) Unless given differently, the not toleranced areas given in this section are to corners, points of tangency between surfaces or at the points opposite to one of these locations. The areas shown will have a tolerance of plus 0.125 inch (3.175 mm) in all directions unless adjacent areas are given as areas where damage is not permitted.

C. Procedure

(1) Visually examine the areas of the drum rotor which you can access with a fluorescent (white) light and use a 3X magnifying glass to examine the surface damage such as nicks, dents, scratches and corrosion pits. See Table 801, Figure 801 (Sheet 1) and Figure 801 (Sheet 2).

NOTE: It is recommended to clean the drum rotor before this inspection procedure by SPOP 209 (Task 70−21−00−110−041). Refer to Section 70−21−00 in the Standard Practices Manual, PN 585005.

(2) Visually examine the knife−edge seals for damage. See Table 802 and Figure 802.

NOTE: Unless the stage 1 stator has been removed for other reasons only the front face of the front knife−edge is seen.

(3) Visually examine the areas of the front compressor hub assembly, that you access with a fluorescent (white) light and use a 3X magnifying glass and a mirror as necessary. See Table 803, Figure 803 (Sheet 1), Figure 803 (Sheet 2), Figure 803 (Sheet 3) and Figure 803 (Sheet 4).

NOTE: It is recommended to clean the hub immediately before this inspection procedure by SPOP 209 (Task 70−21−00−110−041). Refer to Section

70−21−00 in the Standard Practices Manual, PN 585005

(4) Visually examine the No. 1 bearing assembly. Refer to Section 72−09−50, Inspection/Check−03 in the PW4000 Series CIR, PN 51A357 and Section 70−52−00 in the Standard Practices Manual, PN 585005.

(5) Visually examine the fillets of bearing flange and the puller groove for the indication of cracks. Use a 10X magnification. No cracks are permitted.

(6) Visually examine the No. 1 bearing assembly retaining nut. See Table 804 and Figure 804.

(7) Visually examine the stage 1.6, stage 2 and stage 4 LPC blades that can be seen without LPC module disassembly. See Table 805 and Figure 805.

(8) Visually examine the stage 3 LPC blades that can be seen without LPC module disassembly. See Table 806 and Figure 806.

(9) Visually examine the Outer Shroud Assembly. See Table 807, Figure 807 (Sheet 1), Figure 807 (Sheet 2) and Figure 807 (Sheet 3).

(10) Visually examine the blade tip rubstrips that can be seen without module disassembly. See Table 808, Figure 808 (Sheet 1) and Figure 808 (Sheet 2).

(11) Visually examine the LPC stage 4 duct areas that can be seen without disassembly. See Table 809 and Figure 809 (Sheet 1) and Figure 809 (Sheet 2).

(12) Visually examine the LPC stage 1 stator vanes that can be seen without LPC module disassembly. See Table 810 and Figure 810.

(13) Visually examine the stage 1 and stage 3 LPC stator inner shrouds that can be seen without disassembly. See Table 811, Table 812, Figure 811 and Figure 812.

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Drum rotor for: See Figure 801 (Sheet 2)			
1 Weld area for surface damage	No surface damage is permitted without repair	Scattered surface damage to a maximum of 0.010 inch (0.254 mm) in depth is permitted, if blended smooth with the adjacent area.	Refer to Section 72−31−08, Repair−03 in the PW4000 Series CIR, PN 51A357
2 Tierod holes for surface damage. Area is not seen if the fan hub is installed.	No surface damage is permitted other than for very light marks	Hone the tierod holes oversize. Refer to Section 72−31−08, Inspection/ Check−04 in the PW4000 Series CIR, PN 51A357 for the repair limits.	Refer to Section 72−31−08, Repair−08 in the PW4000 Series CIR, PN 51A357
		If the damage cannot be removed by the hone repair, machine the tierod holes oversize and install the bushings. Refer to Section 72−31−08, Inspection/ Check−04 in the PW4000 Series CIR, PN 51A357 for the repair limits.	Refer to Section 72−31−08, Repair−05 in the PW4000 Series CIR, PN 51A357

Drum Rotor Assembly Visual Inspection
Table 801

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
3 Web surface for surface damage. Some areas are not seen if the fan hub is installed.	Smooth marks made by mating parts to a maximum of 0.005 inch (0.127 mm) in depth is permitted. No damage is permitted in 0.125 inch (3.175 mm) of all holes.	Scattered surface damage to a maximum of 0.010 inch (0.254 mm) in depth is permitted only if blended smooth with the adjacent area	Refer to Section 72-31-08, Repair-03 in the PW4000 Series CIR, PN 51A357
4 Cones and bores for surface damage. Some areas are not seen if the module is assembled.	Scattered surface damage to a maximum of 0.003 inch (0.076 mm) in depth is permitted without repair	Scattered surface damage to a maximum of 0.010 inch (0.254 mm) in depth is permitted only if blended smooth with the adjacent area. No damage is permitted in 0.125 inch (3.175 mm) of all holes or blade slot.	Refer to Section 72-31-08, Repair-03 in the PW4000 Series CIR, PN 51A357
5 Rim dovetail slot for damage. This area is not seen when bladed.	No surface damage is permitted without repair	A maximum of 0.002 inch (0.051 mm) in depth is permitted only if blended smooth with the adjacent area	Blend to remove the damage. Refer to Section 70-45-00, SPOP 532 in the Standard Practices Manual, PN 585005.

Drum Rotor Assembly Visual Inspection
Table 801 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
6 Axial blade slot for surface damage. Some areas are not seen when bladed.	Scattered surface damage to a maximum of 0.005 inch (0.127 mm) in depth is permitted	Scattered surface damage to a maximum of 0.015 inch (0.381 mm) in depth is permitted only if blended smooth with the adjacent area	Refer to Section 72−31−08, Repair−03 in the PW4000 Series CIR, PN 51A357
7 Upper axial blade slot for surface damage. This area is not seen when bladed.	Scattered surface damage to a maximum of 0.003 inch (0.076 mm) in depth is permitted	Scattered surface damage to a maximum of 0.010 inch (0.254 mm) in depth is permitted only if blended smooth with the adjacent area	Refer to Section 72−31−08, Repair−03 in the PW4000 Series CIR, PN 51A357
8 Inside rim dovetail slot for surface damage. This area is not seen when bladed.	Scattered surface damage to a maximum of 0.001 inch (0.025 mm) in depth is permitted	Scattered surface damage to a maximum of 0.002 inch (0.051 mm) in depth is permitted only if blended smooth with the adjacent area	Refer to Section 72−31−08, Repair−03 in the PW4000 Series CIR, PN 51A357
9 Front flange inner mating diameter for surface damage. Area is not seen if the fan hub is installed.	Not permitted	Scattered surface damage to a maximum of 0.010 inch (0.254 mm) in depth is permitted only if blended smooth with the adjacent area. Blends cannot take up more than half of the full	Refer to Section 72−31−08, Repair−03 in the PW4000 Series CIR, PN 51A357

Drum Rotor Assembly Visual Inspection
Table 801 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
(CONTINUED)		surface. Blends cannot remove all the materials directly inboard of a bolthole.	
10 Rear flange inner surface for surface damage	Not permitted	Scattered surface damage to a maximum of 0.005 inch (0.127 mm) in depth is permitted only if blended smooth with adjacent area	Refer to Section 72-31-08, Repair-03 in the PW4000 Series CIR, PN 51A357
		Rear flange balance tabs can be blended to 0.250 inch (6.350 mm) radius or the full tab can be removed. A total of four tabs can be removed. No more than two adjacent tabs can be blended and pairs of blended tabs must be separated from the other blended tabs by a minimum of three functional tabs.	Refer to Section 72-31-08, Repair-04 in the PW4000 Series CIR, PN 51A357
11 Balance weight rivet holes for surface damage. Rivet holes are not seen if weights are installed.	No surface damage is permitted other than for marks that have almost	All holes can be honed 0.001 inch (0.025 mm) diameter oversize. Local blend to a maximum of 0.005	Refer to Section 72-31-08, Repair-10 in the PW4000 Series CIR, PN 51A357

Table 803 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
16 Anti-torque slots for surface damage such as nicks, dents, scratches and burrs or rolled material	A maximum of 0.003 inch (0.076 mm) in depth is permitted without repair. Burrs, rolled material or sharp edges are not permitted.	A maximum of 0.040 inch (1.016 mm) in depth	Refer to Section 72-31-07, Repair-15 in the PW4000 Series CIR, PN 51A357
17 Counterweight balance flange	One counterweight balance flange tang can be bent or moved to a maximum of 0.060 inch (1.524 mm) axially rearward. Measure the rearward movement of the flange at the tip. The damage must not extend more than the area shown. The bent tang must be examined by SPOP 70 at ultra high sensitivity. Refer to Section 70-33-00 in the Standard Practices Manual, PN 585005. Cracks are not permitted.	If bent more than 0.060 inch (1.524 mm) or if more than one balance flange tang is damaged, machine away the balance flange tang. Refer to Section 72-31-07, Inspection/ Check-03 in the PW4000 Series CIR, PN 51A357 for the limits on how many and how much of the tangs can be removed.	Refer to Section 72-31-07, Repair-16 in the PW4000 Series CIR, PN 51A357

Compressor (Fan) Hub Visual Inspection
Table 803 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
18 Counterweight balance flange damage. See Figure 803 (Sheet 4)		A total of three tangs can be removed from the hub if no other counterweight tangs are damaged or have been repaired. Only two complete tangs can be removed over a 180 degree arc of the hub if at least two not damaged tangs are between the removed tangs. If only a part of a tang is removed for multiple flange tangs, the total material removed can not add up to more than three complete flange tangs. Two consecutive damaged flange tangs can be repaired if there is at least one remaining rivet hole in each tang. After all the necessary balance flange tangs are removed (either partial or	Refer to Section 72-31-07, Repair-16 in the PW4000 Series CIR, PN 51A357

Task 72-00-31-300-001:

1. Restore Stage 1 LPC Blade Assembly Leading Edge Contour

NOTE: This repair is for engines that had unsatisfactory fan operation during the engine acceptance in 71-00-00, Testing-09. This repair can be used to clean and remove fan blade leading edge damage. After this repair you can test the engine again.

A. Prerequisites

(1) This repair is applicable to fan blade assemblies PN 52A121, 52A121-001, 52A121-002, 52A121-003, 53A321-001, 56A621, 56A821, 53A321, 54A821 and 56A511.

(2) Remove all fan blade assemblies. Refer to Removal-04 (Task 72-00-31-020-002-001 or Task 72-00-31-020-002-002).

(3) Refer to Maintenance Advisory Manual No. MAN-PW4000-2-91 Revision 1 or subsequent for time/cycle information (for airfoil bead peen, blade root shotpeen and antigalling compound application). R

B. Equipment And Materials Necessary

Standard Tools:

3013 Vise	Wilton Tool Company 9525 Irving Park Rd. Schiler Park, IL 60176

Special Tools:

PWA 29646	Gage, Inspection
PWA 29836	Sighting Template
PWA 29914	Angle Cutter
PWA 49065	Template (Optional)
PWA 75431	Marking Template
PWA 75432	Radius Cutter (For PN 52A121, 52A121-001 Blades)
PWA 86054	Handle, Edge Scraper (For PN 53A321, 53A321-001, 56A511, 56A821, 52A121-003, 52A121-002, 54A821, 56A621 Blades)
PWA 86055	Insert, Edge Scraper (For PN 56A621, 53A321-001, 52A121-002, 52A121-003 Blades)
PWA 101157	Insert, Edge Scraper (For 52A121-002, 52A121-003, 53A321-001, 56A821, 56A621

Special Tools:

(CONTINUED)

	Blades)
PWA 101801	Marking Template (For 56A621 Blades)

Consumable Materials:

Item No.	Designation
P05−062	Cloth, Emery #400 grit
P05−252	Pad, Scotch Brite (Very Fine, Type A)
P06−003	Compound, Antigalling (PWA 586) (Fel−Pro C−200)
P06−005	Lubricant (PWA 587)(G−N Metal Assembly Paste)

C. Procedure
See Figure 901 or Figure 902.

Subtask 72−00−31−350−051:

WARNING: TO AVOID POSSIBILITY OF INJURY TO HANDS, GLOVES SHOULD BE WORN WHEN HANDLING BLADES AND USING TOOLS.

CAUTION: USE OF POWER TOOLS OR GRINDING IS NOT PERMITTED.

(1) Clean the blade with a Scotch Brite Pad P05−252 and water. Pay special attention to the leading edge and the first few inches (76.2 mm) of the convex side of the blade.

Subtask 72−00−31−220−051:

(2) Visually inspect blade root attachment surface for galling, pits and depressions.

(3) Blades that have heavy galling wear adjacent to fillet radius, sharp pits and sharp depressions are unacceptable. These blades must be repaired. Refer to the PW4000 Series CIR, PN 51A357, 72−31−82, Repair−05 (Task 72−31−82−300−005).

(4) Check each blade leading edge with PWA 29836 Sighting Template and PWA 29646 Thickness Gage to assure that sufficient material exists to incorporate new leading edge configuration.

NOTE: Thinning or dressing can be accomplished with hand held scraping tools, files and abrasive paper or cloth.

Subtask 72−00−31−350−052:

(5) Clean and paint both sides of the blade leading edge with non−etching, non−corrosive ink, or equivalent coating fluid in preparation for marking work area.

CAUTION: DO NOT USE AN AWL OR METAL SCRIBER WHEN MARKING LOCATIONS ON BLADE, IT CAN LEAVE A STRESS RISER ON BLADE. USE A SHARPENED PIECE OF HARD PLASTIC OR OTHER NON−METALLIC MATERIAL.

(6) With PWA 75431 Marking Template (for PN 52A121 and 52A121−001 blades), scribe a line on the blade to mark the blades transition zones.

(7) Apply masking tape aft of blade leading edge to protect the blade during rework.

(8) Install blade in a Wilton Tool Company Vise 3013 or equivalent soft−jaw vise that will permit blade to be correctly positioned during repair.

(9) Machine the blade leading edge as shown in the referenced figure for the entire length of the blade. Remove material as necessary with PWA 29914 Cutter to form the 10 degree angle. To form the blade leading edge radius, use PWA 75432 Cutter (for PN 52A121 and 52A121−001 blades) or PWA 86054 Handle with PWA 86055 Scraper (for PN 53A321−001, 52A121−002, 53A121−003, 56A821 and 56A621 blades). Hand held scrapping tools, files and abrasive paper or cloth can be used but material removal must be uniform along leading edge.

(10) Do not remove more material than necessary and limit removal to 0.100 inch (2.540 mm) maximum.

NOTE: A tapered cut, starting at tip and extending to blade root fillet is optional.

(a) If necessary, after material has been removed, use the optional PWA 49065 Template to check the blade chord length. The minimum chord length at each section of blade as specified in Figure 903 or 904 as applicable must be maintained.

Subtask 72−00−31−320−003−001:

(11) Polish repair area to remove scratches and machine marks. Refer to SPOP 532 in the Standard Practices Manual, PN 585005.

Subtask 72−00−31−300−003:

(12) See Maintenance Advisory Notice No. MAN−PW4000−2−91 for airfoil bead peen requirements.

(a) If not beyond the limits specified in the MAN, bead peen is not required.

(b) If beyond the limits specified in the MAN, bead peen is required. Refer to the PW4000 Series CIR, PN 51A357, 72−31−82, Repair−03 (Task 72−31−82−300−003).

Subtask 72−00−31−300−007:

(13) See Maintenance Advisory Notice No. MAN−PW4000−2−91 for blade root shotpeen requirements.

(a) If not beyond the limits specified in the MAN, blade root shotpeen is not required.

(b) If beyond the limits specified in the MAN, blade root shotpeen is required. Refer to the PW4000 Series CIR, PN 51A357, 72−31−82, Repair−07 (Task 72−31−82−300−007).

Subtask 72−00−31−300−006:

(14) See Maintenance Advisory Notice No. MAN−PW4000−2−91 for blade root antigallant compound requirements.

(a) If not beyond the limits specified in the MAN, you can lubricate the blade root with Antigalling Compound P06−003.

(b) If beyond the limits specified in the MAN, you must replace the blade root antigalling compound. Refer to the PW4000 Series CIR, PN 51A357, 72−31−82, Repair−06 (Task 72−31−82−300−006).

Subtask 72−00−31−350−053:

(15) Lubricate each shroud hardface contact surface with Lubricant P06−005.

Subtask 72−00−31−300−008:

(16) If necessary, install new blade platform seal. Refer to the PW4000 Series CIR, PN 51A357 72−31−82, Repair−08 (Task 72−31−82−300−008).

Subtask 72−00−31−220−052:

(17) Measure depth of cut made in leading edge.

(18) Use the vibropeen marking method to record the depth of cut on the blade platform.

D. Postrequisites

(1) Install all fan blade assemblies. Refer to Installation−04 (Task 72−00−31−420−002−002).

ENGINE GENERAL - LPC/LPT COUPLING - REMOVAL-01

Task 72-00-32-020-001:

1. Remove The LPC/LPT Coupling (With The Front Compressor Drive Turbine Shaft Installed)

NOTE: See Figure 301 for Part/Assembly Removal Procedure Sequence.

A. Prerequisites

(1) Remove The Electronic Engine Control (EEC) Speed Transducer (N1). Refer to 72-00-34, Removal-03 (Task 72-00-34-050-001).

(2) Remove The Compressor Inlet Cone. Refer to 72-00-31, Removal-02 (Task 72-00-31-020-001).

(3) Remove All Stage 1 LPC Blade Assemblies. Refer to 72-00-31, Removal-04 (Task 72-00-31-020-002-002).

NOTE: Coupling may be removed with fan blades installed provided no further disassembly is anticipated. However, six (6) shims must be placed between lower fan blade tips and fan case rubstrip to support LPC rotor.

B. Equipment And Materials Necessary

Standard Tools:
.190-32 Jackscrews, Eight Necessary Per Text

Special Tools:

PWA 3755	Hydraulic Pump (Optional To PWA 29389)
PWA 18872	Wrench, Hydraulic*
PWA 25000	Wrench, Hydraulic*
PWA 28668	Pump, Hydraulic (Use With Hydraulic Wrench)
PWA 28669	Cart (Optional) (Use With Hydraulic Wrench)
PWA 28814	Pump, Hydraulic* (Use With Hydraulic Wrench)
PWA 29389	Hydraulic Pump
PWA 29510	Pump, Hydraulic (Hand) (Use With Hydraulic Wrench)
PWA 29614	Wrench, Mechanical*
PWA 29615	Holder (Use With Mechanical Wrench)
PWA 33732	Wrench, Hydraulic*
PWA 45418	Wrench, Mechanical*
PWA 45419	Air Torque Multiplier* (Use With Mechanical Wrench)

ENGINE GENERAL − LPC/LPT COUPLING − REMOVAL−01

Special Tools:

(CONTINUED)

PWA 75046	Cart, Storage* (Optional) (Use With Hydraulic Wrench)
PWA 80070	Wrench, Hydraulic*
PWA 80071	Multiplier, Torque* (Use With Mechanical Wrench)
PWA 80187	Wrench, Mechanical*
PWA 80651	Multiplier, Pneumatic* (Use With Mechanical Wrench)
PWA 85298	Puller, Jackscrew
PWA 85299	Adapter, Wrench* (Use With Mechanical Wrench)
PWA 85300	Wrench, Torque*
PWA 85301	Adapter, Holding (Use With Mechanical Wrench)
PWA 85302	Wrench, Torque (Use With Mechanical Wrench)
PWA 85306	Puller, Knocker
PWA 85307	Puller, Jackscrew
PWA 85507	Adapter, Holding (Use With Hydraulic Wrench)
PWA 85508	Wrench, Torque (Use With Hydraulic Wrench)
PWA 85514	Wrench, Torque* (Use With Hydraulic Wrench)
PWA 85515	Adapter, Holding* (Use With Hydraulic Wrench)
PWA 85769	Fixture, Install/Remove
PWA 86325	Fixture, Retainer (Optional To PWA 86437)
PWA 86437	Fixture, Retainer (Optional To PWA 88222)
PWA 86515	Protector, Plastic
PWA 86604	Stand, Transport
PWA 87354	Wrench, Hydraulic*
PWA 88222	Fixture, Retainer
PWA 102460	Adapter, Wrench* (Use With Mechanical And Hydraulic Wrench)

*Refer to Table 301 for the mechanical wrench tools or Table 302 for the hydraulic wrench tool as applicable. Tables 301 and 302 showthe correct combinations of tools for the removal of the turbine shaft nut.

C. Procedure

(1) Install PWA 86515 Protector in the ID of the front compressor hub assembly (called hub). The tabs of the protector snap in the bore of the hub.

(2) Remove the key washer retaining ring and retaining nut key washer that attach the turbine shaft plug at the front of the turbine shaft coupling assembly (called coupling). With PWA 85306 Puller, remove the plug and discard the packing. See Figure 302.

(3) For operators that use the mechanical wrench, remove the turbine shaft (coupling/retaining) nut (called nut) as follows.

NOTE: See the following step to remove the turbine shaft (coupling/retaining) nut with the optional Hydraulic Wrench.

(a) Install PWA 85301 Adapter in the coupling. See Figure 303.

1 Slide three "L" shaped clamps toward adapter centerline.

2 Place adapter into coupling against inner slotted flange until keys locate slots of coupling. Slide "L" clamps outward and secure.

(b) Install PWA 85302 Torque Wrench on the nut.

1 Slide wrench over adapter and index wrench to engage slots in the nut.

2 Slide clamps radially outward to engage grooves in nut. Install wrench so that wrench holes are at 3 and 9 o'clock locations.

3 Secure wrench in place using three clamps.

(c) With a hoist, lift PWA 29614 Mechanical Wrench. Install it on the torque wrench.

(d) Install PWA 29615 Holder on the mechanical wrench. As you install the holder, engage the pins on the mechanical wrench and the splines on the adapter.

(e) Install either PWA 80651 Pneumatic Multiplier or PWA 45419 Pneumatic Multiplier on the mechanical wrench.

(f) Loosen the nut. Remove the tools and the nut from the hub.

(4) For operators that use the Hydraulic Wrench, remove the turbine shaft (coupling/retaining) nut (called nut) as follows.

(a) Install PWA 85507 Adapter into coupling. See Figure 304.

1 Slide three wing nuts toward adapter centerline.

2 Place adapter into front end of coupling until keys locate slots of coupling. Slide clamps outward and secure.

(b) Install PWA 85508 Torque Wrench and PWA 25000 Hydraulic Wrench.

1 With a hoist, remove the hydraulic wrench from PWA 28669 Cart.

2 Attach torque wrench to the hydraulic wrench and install both as a unit over adapter using hoist and nylon strap.

3 Engage teeth of torque wrench with slots in nut. Align splines of adapter with splines in hydraulic wrench.

4 Attach either PWA 28668 Pump or PWA 29510 Pump to the hydraulic wrench. Loosen the nut.

(c) Remove tooling and nut from hub.

(5) Remove key washer retaining ring and key washer securing turbine shaft nut to LPC shaft. See Figure 302.

(6) For operators that use the mechanical wrench, remove the turbine shaft nut as follows. See Table 301 for the correct combinations of tools. Refer to Figure 305.

NOTE: See the following step to remove the turbine shaft nut with the optional Hydraulic Wrench.

PWA Torque Wrench	PWA Holder Adapter	PWA Mechanical Wrench or Torque Multiplier	PWA Pneumatic Multiplier
85300	102460 or 85299	80187	80651 or 45419
85300	102460 or 85299	45418	45419

Turbine Shaft Nut Removal Tools (Mechanical Wrench)
Table 301

(a) Install PWA 102460 Adapter or PWA 85299 Adapter into coupling.

1 Loosen wing nuts and slide three clamps radially inward.

2 Align keys in adapter with slots in coupling and install. Adjust adapter for mechanical wrench attachment at 3 and 9 o'clock location.

3 Slide three clamps radially outward to engage lugs of coupling. Tighten wing nuts to secure clamps.

(b) Install PWA 85300 Torque Wrench.

1 Install the torque wrench in the center of the adapter. Align the splines of the wrench with the splines of the nut. Push the wrench until it touches the face of the turbine shaft nut.

(c) With a hoist, lift a mechanical wrench. Refer to Table 301 for tool choices. Install the mechanical wrench on the torque wrench, splines engaged. Push the mechanical wrench to touch the face of the adapter. Engage the pins of the mechanical wrench with the holes in the torque wrench.

(d) Install a pneumatic multiplier on the mechanical wrench.

(e) Loosen the turbine shaft nut. Remove the tools, nut, and flat washer.

(7) For operators that use the Hydraulic Wrench, remove the turbine shaft nut (called nut) as follows. See Table 302 for the correct combinations of tools.

PWA Torque Wrench	PWA Holding Adapter	PWA Hydraulic Wrench	PWA Pump	PWA Cart
85514	85515	33732	28814 or 29510	75046
85514	85515	18872	28814 or 29510	75046
85300	102460 or 85299	87354	28814 or 29510	75046
85300	102460 or 85299	80070	28814 or 29510	75046

Turbine Shaft Nut Removal Tools (Hydraulic Wrench)
Table 302

(a) (Method 1) See Figure 306 (Sheet 1).

1 Attach PWA 85515 Adapter to a hydraulic wrench. Install the adapter/wrench in the coupling. Lock the detail clamps behind the lugs in the coupling.

2 Install PWA 85514 Torque Wrench in the adapter, engaging the splines of the wrench with the splines in the coupling and the hydraulic wrench.

3 Connect a pump to the hydraulic wrench.

4 Remove the tools, nut, and flat washer.

(b) (Method 2) See Figure 306 (Sheet 2).

1 Install PWA 102460 Adapter or PWA 85299 Adapter in the coupling, the detail keys in the slots of the coupling. With the three detail clamps to the rear of the slots in the coupling, tighten the clamps.

2 Install PWA 85300 Torque Wrench in the center of the adapter, engaging the splines of the nut.

3 Push the torque wrench until it touches the face of the nut.

4 With a hoist, lift a hydraulic wrench and install it on the torque wrench, engaging splines. Engage the pins of the hydraulic wrench in the holes of the adapter.

5 Connect a pump to the hydraulic wrench.

6 Remove the tools, nut, and flat washer.

(8) (Post SB PW4ENG 79−76) Remove No. 4 bearing (oil) pressure tube. See Figure 307.

NOTE: It is not necessary to remove the (Pre SB PW4ENG 79−76) No. 4 bearing (oil) pressure tube.

(a) Remove the No. 4 pressure tube (307/10) from the turbine exhaust case at the 4:30 o'clock position.

1 Remove two bolts (307/1) that attach the tube shield (307/16) and bracket (307/2) to the turbine exhaust case.

2 Remove the tube shield (307/16), bracket (307/2), thrust wire (307/18) and nut (307/17) from the outboard end of the pressure tube.

3 Remove the bolt (307/6) and nut (307/12) that attach the tube clamp (307/7) and tube to the bracket (307/8).

4 Cut the restraining straps (307/3) and remove the insulation slide clamp (307/13) and shield sets (307/9) and (307/4) from the tube.

5 Remove the tube nut from the adapter (307/14) and move the tube radially inward and remove the pressure tube from the case.

(b) Install a protective cover on the adapter (307/14).

(c) Secure bolts (307/5) and bracket (307/8) on the turbine exhaust case.

(9) Remove 30 bolts (308/6) securing No. 4 bearing shield (308/5) to turbine exhaust case (rear inner flange) (308/1). Remove shield. Remove No. 4 bearing heat shield (308/4). See Figure 308.

(10) Remove No. 4 bearing cover (308/3).

(a) For No. 4 bearing cover (308/3) that has six small threaded holes (Pre SB PW4ENG 72−385), install the PWA 85307 Jackscrew Puller to the rear inner bolt hole flange (Flange T1) of the exhaust case and attach with two bolts, washers and nut details. Install the small plate of the puller to the six threaded holes in the cover and attach with six knurled screw details. Turn the jackscrew to disengage the cover from the exhaust case. Remove the puller and the cover from the exhaust case. Remove the cover from the puller. Discard the packing (308/2).

(b) For cover that has eight jackscrew holes (Post SB PW4ENG 72−385), install and evenly tighten eight 0.190−32 Jackscrews to remove the cover. Discard the packing (308/2).

(11) (Pre SB PW4ENG 72−472) Remove the No. 4 bearing (oil) nozzle and No. 4 bearing packing transfer tube from boss in the exhaust case (No. 4 bearing compartment) at 1:30 o'clock position. See Figure 309.

(a) Remove bolts (309/8) and key washers (309/6) and (309/7) securing No. 4 bearing packing transfer tube (309/5) to No. 4 bearing nozzle (309/4). Remove tube.

(b) Remove bolts (309/1) and key washers (309/2) and (309/3) securing No. 4 bearing nozzle (309/4) to exhaust case. Remove nozzle.

(12) (Post SB PW4ENG 72−472) Remove the No. 4 bearing (oil) nozzle and front No. 4 bearing nozzle. See Figure 310.

(a) Remove the bolts and key washer (310/1) that attach the front No. 4 bearing nozzle to the No. 4 bearing support flange at the 12 o'clock position. Discard the key washer.

(b) Move the packing transfer tube (310/15) into the elbow of the No. 4 bearing damper supply tube (310/12). Remove the nozzle.

(c) Remove the packing transfer tube from the damper supply tube. Discard the two packings (310/14).

(d) Remove the bolts and key washers (310/16) and (310/17) that attach the No. 4 bearing damper supply tube (310/12) to the No. 4 bearing oil nozzle (310/11). Remove the tube.

(e) Remove the bolts and key washers (310/16) and (310/17) that attach the No. 4 bearing nozzle (310/11) to the exhaust case. Remove the nozzle.

(13) Remove the No. 4 bearing oil scavenge (inner) tube. See Figure 311.

(a) Remove Bolts (311/5 and 311/6) and key washers (311/4 and 311/7). Remove oil scavenge (inner) tube (311/8) from the turbine exhaust case.

(b) Remove and discard gasket (311/3).

(c) Cover hole in tube attachment pad on the case with a protective cover.

(14) Remove the eight bolts (312/1) that attach the No. 4 bearing retaining plate to the front compressor drive shaft (312/2). See Figure 312.

(15) Install PWA 86437 Fixture or PWA 86325 Fixture to attach the low pressure turbine shaft to the turbine exhaust case. See Figure 313 (Sheet 1).

NOTE: Use PWA 86325 Fixture with turbine exhaust cases that are (Pre SB PW4ENG 72−456). Use PWA 86437 Fixture with either (Pre or Post SB PW4ENG 72−456) turbine exhaust cases.

(a) Remove eight bolts securing No. 4 bearing retaining plate.

(b) Install inner slide (313/5) in ID of No. 4 bearing retaining plate and secure with eight detail screws (313/1).

(c) Install outer slide (313/4) over inner slide, locating slot in outer slide over key on inner slide.

(d) Rotate turbine shaft until scallops in flange of outer slide assembly align oil pressure and scavenge tubes protruding from exhaust case flange. Secure outer slide to exhaust case with eight detail bolts (313/2).

(e) Tighten eight cap screws (313/3).

(16) Install PWA 88222 Fixture or PWA 86437 Fixture to attach the low pressure turbine shaft to the turbine exhaust case. See Figure 313 (Sheet 2).

NOTE: Use PWA 88222 Fixture with (Pre or Post SB PW4ENG 72−456) turbine exhaust cases.

(a) Remove the eight bolts that attach the No. 4 bearing retaining plate.

(b) Loosen the locknuts that hold the tube and guide assemblies together and install the fixture to the ID of the turbine exhaust case. The tube assembly detail will mate against the No. 4 bearing retaining plate and the guide assembly detail will mate against the rear inner flange of the exhaust case. Attach the fixture with the captured capscrews of both details.

NOTE: If necessary, turn the LPT rotor to align the holes in the end of the 7th stage disk or LPT shaft, as applicable, with the captured capscrews of the tube assembly detail.

(c) Tighten the capscrews of both details to lock the fixture in position.

(17) Install PWA 85769 Fixture to remove the turbine shaft coupling assembly as follows. See Figure 314.

(a) Thread detail−35 shaft into LPT shaft until it bottoms on shoulder.

(b) Guide assembly of details −8 body, −9 adapter, −10 rod, −21 plate, −29 housing and −31 pin over installed detail−35.

(c) Retract spring loaded pin and rotate detail−21 to position lugs on plate behind lugs in front end of coupling. Release spring loaded pin to lock tooling.

(d) Thread detail−27 locator into front end of No. 1 hub until it bottoms out. Thread detail−15 backup nut assembly, handle end first onto threaded end of detail−35.

(e) Secure detail−7 cover to detail−27 with six bolts in locator. Be sure detail−15 nut does not contact detail−27 locator with detail−7 cover.

(f) Install the two detail−12 hydraulic rams over detail−10 threaded rods and secure with detail−11 nuts fingertight.

(g) Rotate detail−15 nut to contact detail−7 cover.

(h) Install detail−11 nut over detail−35 shaft assembly until it also contacts detail−7 cover.

(i) Attach hydraulic hose assembly and PWA 3755 Hydraulic Pump or PWA 29389 Hydraulic Pump to hydraulic rams. Actuate pump enough to disengage interference fit diameters of coupling. Release pressure.

(18) Remove hydraulics cover and backup nut. Secure detail−3 adapter to detail−9 adapter located at center of fixture with detail−4 bolts in adapter.

(19) With hoist, lift detail−1 arm and secure it to end of detail−9 adapter with detail−2 eye bolts.

(20) With slight tension on hoist, remove coupling from engine. Attach second hoist to eye bolt and trunnion coupling rear end down onto work bench. Remove tooling from coupling. Put the details of PWA 85769 Fixture on PWA 86604 Transport Stand. See Figure 315.

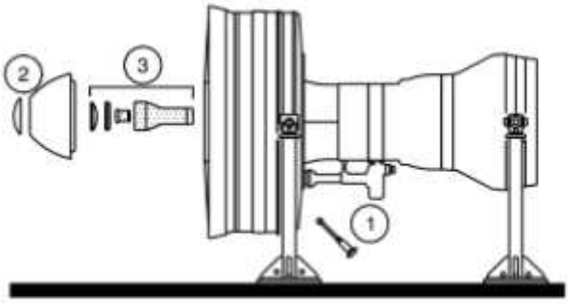
NOTE: Classified spacer will remain in LPT shaft. If spacer is to be removed use PWA 85298 Puller to remove spacer.

ENGINE GENERAL − LPC/LPT COUPLING − REMOVAL−01

D. Postrequisites

(1) Remove The No. 1.5 Bearing And Seal Seat. Refer to 72−00−32, Removal−03 (Task 72−00−32−030−001).

ENGINE GENERAL − LPC/LPT COUPLING − REMOVAL−01



1. REMOVE ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).
2. REMOVE COMPRESSOR INLET CONE.
3. REMOVE LPC/LPT COUPLING.

ENGINE GENERAL - LPC/LPT COUPLING - REMOVAL-02

Task 72-00-32-020-001-002:

1. Remove The LPC/LPT Coupling (With The Front Compressor Drive Turbine Shaft Installed) (Hydraulic Wrench) - Deleted

   A. Procedure

      (1) This procedure is relocated to 72-00-32, Removal-01 (Task 72-00-32-020-001).

Task 72-00-32-030-001:

1. Remove The No. 1.5 Bearing And Seal Seat

A. Prerequisites

(1) Remove The LPC/LPT Coupling (With The Front Compressor Drive Turbine Shaft Installed). See Removal-01 (Task 72-00-32-020-001).

B. Equipment And Materials Necessary

Special Tools:

PWA 3755	Pump, Hydraulic (Optional To PWA 29389)
PWA 18872	Wrench, Hydraulic*
PWA 28814	Pump, Hydraulic* (Use With Hydraulic Wrench)
PWA 28815	Cart, Storage (Optional)* (Use With Hydraulic Wrench)
PWA 29389	Hydraulic Pump
PWA 29510	Pump, Hydraulic (Hand)* (Use With Hydraulic Wrench)
PWA 33732	Wrench, Hydraulic*
PWA 45418	Wrench, Mechanical*
PWA 45419	Air Torque Multiplier* (Use With Mechanical Wrench)
PWA 75046	Cart (Optional)* (Use With Hydraulic Wrench)
PWA 76154	Adapter
PWA 80070	Wrench, Hydraulic*
PWA 80071	Multiplier, Torque* (Use With Mechanical Wrench)
PWA 80187	Wrench, Mechanical*
PWA 80651	Multiplier, Pneumatic* (Use With Mechanical Wrench)
PWA 85261	Adapter
PWA 85264	Adapter, Holding* (Use With Mechanical And Hydraulic Wrench)
PWA 85265	Wrench, Torque* (Use With Mechanical And Hydraulic Wrench)
PWA 85266	Puller
PWA 85375	Plate, Anchor* (Use With Mechanical Wrench)
PWA 85468	Stand
PWA 85516	Wrench, Torque* (Use With Hydraulic Wrench)
PWA 85517	Adapter, Holding* (Use With Hydraulic Wrench)
PWA 85632	Puller, Jackscrew
PWA 87354	Wrench, Hydraulic*

Special Tools:

(CONTINUED)

PWA 88100	Plate, Anchor* (Use With Mechanical And Hydraulic Wrench)
R PWA 101263	Protector, Plastic (No. 1.5 Bearing Carbon Seal)

*See Table 301 for mechanical wrench or Table 302 for hydraulic wrench tool options as applicable. The tables show the correct combinations of tools to remove the No. 1.5 bearing (inner race) retaining nut.

C. Procedure

(1) Install PWA 85261 Adapter to coupling. Attach PWA 76154 Adapter to suitable sling to lift and/or trunnion coupling. Install coupling in PWA 85468 Stand, bearing end up. See Figure 301.

(2) For operators that use the mechanical wrench, remove the No. 1.5 bearing (inner race) retaining nut (called nut) as follows. See Figure 302 and Table 301 for the correct combination of tools.

NOTE: See the following step to remove the No. 1.5 bearing (inner race) retaining nut with the optional Hydraulic Wrench.

PWA Torque Wrench	PWA Holding Adapter	PWA Mechanical Wrench or Torque Multiplier	PWA Pneumatic Multiplier	PWA Anchor Plate
85265	85264	80187	80651 or 45419	88100 or 85375
85265	85264	45418	45419	88100 or 85375
85265	85264	80071	80651 or 45419	88100

Retaining Nut Removal (Mechanical Wrench)
Table 301

(a) Remove the retaining ring. Remove the key washer.

(b) Install the big end of PWA 85264 Adapter in the coupling, aligning splines.

(c) Install PWA 85265 Torque Wrench on the coupling, with the teeth of the wrench and the slots of the nut aligned.

(d) Install a mechanical wrench on the torque wrench.

(e) Install an anchor plate on the mechanical wrench, with the pins of the wrench engaged with the holes of the anchor plate.

(f) Loosen and remove the nut. Remove the tools.

(3) For operators that use the hydraulic wrench, remove the No. 1.5 bearing (inner race) retaining nut (called nut) as follows. See Table 302 for the correct combinations of tools.

(a) Remove the retaining ring. Remove the key washer.

PWA Torque Wrench	PWA Holding Adapter	PWA Hydraulic Wrench	PWA Pump	PWA Cart
85516	85517	33732	28814 or 29510	75046
85516	85517	18872	28814 or 29510	75046 or 28815
85265	85264	87354	28814 or 29510	75046
85265	85264	80070	28814 or 29510	75046

Retaining Nut Removal (Hydraulic Wrench)
Table 302

(b) (Method 1) See Figure 303 (Sheet 1).

1 Install the big end of PWA 85517 Adapter in the coupling, aligning splines.

2 Install PWA 85516 Torque Wrench on the coupling, with the teeth of the wrench and the slots of the nut aligned.

3 Attach a hydraulic wrench to the adapter.

4 Attach a pump to the hydraulic wrench. Loosen and remove the nut. Remove the tools.

(c) (Method 2) See Figure 303 (Sheet 2).

1 Install the big end of PWA 85264 Adapter in the coupling, aligning splines.

2 Install PWA 85265 Torque Wrench on the coupling, with the teeth of the wrench and the slots of the nut aligned.

3 Install a hydraulic wrench on the torque wrench.

4 Install PWA 88100 Anchor Plate on the adapter and engage the holes of the anchor plate with the pins of the hydraulic wrench.

5 Attach a pump to the hydraulic wrench. Loosen and remove the nut. Remove the tools.

(4) Remove the seal seat from the coupling. Put the seal seat in a container that prevents contamination.

(5) Remove the No. 1.5 roller bearing from the coupling. Figure 304.

(a) Install PWA 85266 Puller on the bearing. With PWA 3755 or PWA 29389 Hydraulic Pump, remove the bearing from the coupling.

NOTE: Use gloves when you touch the bearing. Refer to the Standard Practices Manual.

(b) Put the bearing in a container that prevents damage and contamination.

(6) Remove the bearing outer race from the No. 1.5 bearing support. Refer to Figure 305.

(a) Remove sixteen (16) retaining bolts, nine (9) washers, and bracket from 1.5 bearing outer race flange.

R
R

R CAUTION: BE CAREFUL NOT TO DAMAGE THE NO. 1.5
R BEARING CARBON SEAL WHEN YOU INSTALL OR
R REMOVE THE PWA 101263 PLASTIC PROTECTOR.

R (b) Install the PWA 101263 Plastic Protector onto the
R No. 1.5 bearing carbon seal.

R (c) Install three (3) guide pin details of PWA 85632 Puller into approximately equally spaced clinch nuts in front flange of bearing support.

R (d) Slide puller jaws inboard. Secure jaws in position with retaining bolts.

R (e) Turn three (3) jackscrews to bottom six 0.250 inch (6.350 mm) diameter dowel pins against outer ring of puller.

CAUTION: ENSURE PULLER LEGS DO NOT CONTACT NUMBER 1 1/2 AND 2 BEARING CARBON SEAL ASSEMBLY WHILE INSTALLING PULLER.

R (f) Carefully guide puller over previously installed guide pins. Bottom inner ring detail against front flange of bearing support.

R (g) Slide three (3) puller legs outboard to engage bearing outer race. Secure puller legs in position with bolts.

R (h) Turn all three (3) jackscrews equally to remove bearing outer race from support.

NOTE: To prevent puller from binding, turn each jackscrew one turn at a time.

ENGINE GENERAL − LPC/LPT COUPLING − REMOVAL−04

Task 72−00−32−030−001−002:

1. Remove The No. 1.5 Bearing And Seal Seat (Hydraulic Method) − Deleted

A. Procedure

(1) This procedure is relocated to 72−00−32, Removal−03 (Task 72−00−32−030−001).

ENGINE GENERAL - LPC/LPT COUPLING - REMOVAL-05

Task 72-00-32-020-005:

1. Remove The LPC/LPT Coupling (With The Front Compressor Drive Turbine Shaft Removed)

NOTE: See Figure 301 for Part/Assembly Removal Procedure Sequence.

A. Prerequisites

(1) Remove The Electronic Engine Control (EEC) Speed Transducer (N1). Refer to 72-00-34, Removal-03 (Task 72-00-34-050-001) or The EEC Speed Transducer (N1) Multiplexer Input Probe, 72-00-34, Removal-17 (Task 72-00-34-050-014).

(2) Remove The Compressor Inlet Cone. Refer to 72-00-31, Removal-02 (Task 72-00-31-020-001).

(3) Remove All Stage 1 LPC Blade Assemblies. Refer to 72-00-31, Removal-04 (Task 72-00-31-020-002-002).

NOTE: If you do not disassemble the engine after this procedure, it is not necessary to remove the fan blades. If you do not remove the fan blades, you must put six shims between the tips of the lower fan blades and the fan case rubstrip to support the LPC rotor.

(4) Remove The Low Pressure Turbine And Turbine Exhaust Case With Shaft. Refer to 72-00-53, Removal-08 (Task 72-00-53-020-002).

B. Equipment And Materials Necessary

Special Tools:

PWA 3755	Pump, Hydraulic
PWA 25000	Wrench, Hydraulic

C. Procedure

(1) Install PWA 86515 Protector in the ID of the front compressor hub assembly (called hub). It snaps in the bore of the hub.

(2) For operators that use the mechanical wrench, remove the turbine shaft (coupling/retaining) nut (called nut) from the front compressor hub assembly (called hub) as follows. Refer to Figure 302.

(a) Install PWA 85301 Adapter in the coupling as follows.

1 Move the three detail clamps toward the center of the adapter.

2 Install the adapter in the coupling. Engage the keys of the adapter in the inner slots of the coupling. Move the clamps outward, behind the lugs in the coupling, and tighten them.

(b) Install PWA 85302 Wrench in the nut as follows.

1 Install the wrench over the adapter. Engage the keys of the wrench in the slots of the nut.

2 Move the detail clamps outward to engage the groove in the nut. Tighten the clamps.

(c) Hold PWA 29614 Mechanical Wrench with a hoist.

(d) Install the mechanical wrench on PWA 85302 Wrench.

ENGINE GENERAL − LPC/LPT COUPLING − REMOVAL−05

(e) Install PWA 29615 Holder on the mechanical wrench. Engage the holes in the holder with the pins on the wrench. Engage the splines of the holder with the splines of the adapter.

(f) Operate the wrench to loosen the nut.

NOTE: It is permitted to use PWA 80651 or PWA 45419 Pneumatic Multiplier.

(g) Remove the removal tools and nut from the hub.

(3) For operators that use the hydraulic wrench, remove the turbine shaft (coupling/retaining) nut (called nut) from the hub. See Figure 303.

(a) Install PWA 85507 Adapter in the coupling as follows.

1 Move the three detail clamps toward the center of the adapter.

2 Install the adapter in the coupling.

3 Engage the keys of the adapter in the inner slots of the coupling. Move the clamps outward behind the lugs of the coupling and tighten them.

(b) Install PWA 85508 Torque Wrench in the nut as follows.

1 With a hoist and sling, lift PWA 25000 Hydraulic Wrench from PWA 28669 Cart.

2 Attach the torque wrench to the hydraulic wrench. Install them together over the adapter.

3 Install the wrenches over the adapter.

4 Engage the keys of the wrench in the slots of the nut. Align the splines of the hydraulic wrench with the splines of the adapter.

(c) Attach either PWA 28668 or PWA 29510 Pump to the hydraulic wrench.

(d) Operate the hydraulic wrench and loosen the nut.

(e) Remove the removal tools and nut from the hub.

(4) Install PWA 85769 Fixture on the coupling as follows. See Figure 304.

(a) Install the assembly of the detail body, locating plate, and detail−10 rods in the coupling. The lugs on the locating plate must be aligned with the slots in the ID of the coupling.

(b) Pull back the detail dowel pin and turn the detail locating plate until the lugs on the plate are behind the lugs that are in the ID of the coupling. Release the pin to lock the locating plate in position.

(c) Install the detail locator in the hub. Turn the locator in the threads in the ID of the hub.

(d) Attach the detail cover to the detail locator with the three detail screws.

(e) Install the two hydraulic cylinders over the two detail−10 rods. Attach the cylinders with two detail nuts. Tighten the nuts with your fingers.

(5) Remove the coupling as follows.

(a) Attach the hydraulic hose assembly and PWA 3755 or PWA 29389 Hydraulic Pump to the hydraulic cylinders.

(b) Operate the pump to disengage the coupling from the hub, but not more. Release the pressure.

(c) Remove the hydraulic cylinders and the detail cover.

(d) Attach the detail−3 adapter to the detail−9 adapter at the center of the fixture with the four detail hex head bolts.

(e) Lift the detail−1 arm with a hoist. Attach it to the end of the detail−9 adapter with the detail−2 eyebolt.

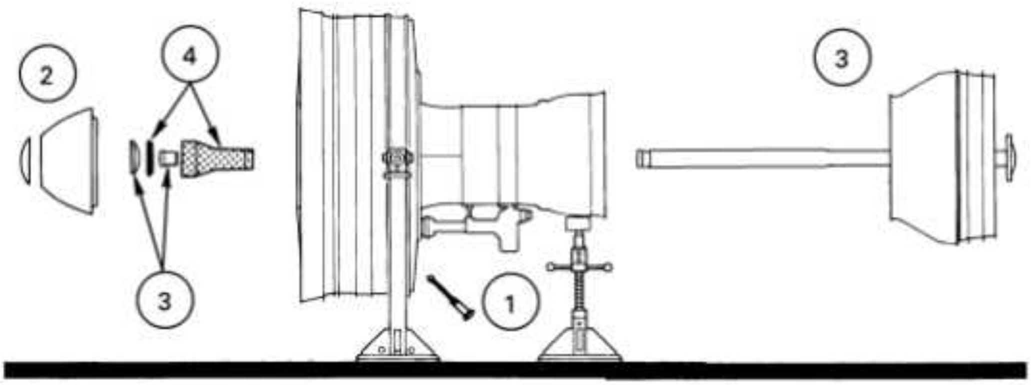
(f) With light tension on the hoist, remove the coupling from the engine. Attach a second hoist to the eyebolt. Trunnion the coupling to rear end down on a work bench. Remove the tool details from the coupling. Put them on PWA 86604 Transport Stand. See Figure 305.

(6) Remove the protector from the hub.

D. Postrequisites

(1) If you will replace the No. 1.5 bearing or if you will disassemble the engine, do Removal−03 (Task 72−00−32−030−001).

ENGINE GENERAL − LPC/LPT COUPLING − REMOVAL−05



1. REMOVE ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).
2. REMOVE COMPRESSOR INLET CONE.
3. REMOVE THE LOW PRESSURE TURBINE AND TURBINE EXHAUST CASE WITH THE SHAFT.
4. REMOVE LPC/LPT COUPLING.

ENGINE GENERAL - LPC/LPT COUPLING - REMOVAL-06

Task 72-00-32-020-005-002:

1. Remove The LPC/LPT Coupling (With The Front Compressor Drive Turbine Shaft Removed) (Hydraulic Wrench) - Deleted

A. Procedure

(1) This procedure is relocated to 72-00-32, Removal-05 (Task 72-00-32-020-005).

Task 72−00−32−420−001:

1. Install LPC/LPT Coupling (With The Front Compressor Drive Turbine Shaft Installed)

NOTE: See Figure 401 for Part/Assembly Installation Procedure Sequence.

A. Prerequisites

(1) See 72−00−32, Inspection/Check−01 (Task 72−00−32−990−001) for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by reference number. For example: (Reference 1234) Torque retaining nut as follows.

(2) Install The No. 1.5 Bearing And Seal. Refer to 72−00−32, Installation−03 (Task 72−00−32−430−001).

B. Equipment And Materials Required

Special Tools:

PWA 3755	Pump, Hydraulic
PWA 18872	Wrench, Hydraulic*

PWA 101021	Rod, Installation
PWA 102460	Adapter, Wrench* (Use With Mechanical And Hydraulic Wrench)

*Refer to Table 402 for the mechanical wrench or Table 403 the hydraulic wrench tool options. These tables show the correct combinations of tools for the installation of the turbine shaft nut.

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P06-002	Petrolatum, White (PMC 9609)
P06-021	Compound, Antigalling (PWA 550-3)
P06-054	Paste, Anti-Seize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Key Washer	8	72-54-00/4/110
Packing	1	72-32-00/2/30
Packing	1	72-54-00/5/90

Lockwire, AS3214-02

ENGINE GENERAL - LPC/LPT COUPLING - INSTALLATION-01

C. Procedure

NOTE: Calculation of the spacer classification is not necessary if the associated and mating parts have not changed. The original removed spacer can be used.

(1) Install PWA 86515 Protector in the ID of the front compressor hub assembly (called hub). It snaps in the bore of the hub. See Figure 402.

(2) Measure Dimension AJ on the hub and Dimension AK on the LPC/LPT coupling. Record these dimensions.

(3) Measure Dimension C on the coupling. Record Dimension C. See Figure 403.

(4) Calculate Dimension AL: subtract Dimension AK from Dimension AJ. Write Dimension AL.

$$AL = AJ - AK$$

(5) If PWA 86325 Fixture or PWA 86437 Fixture is not installed, install fixture to the low pressure turbine shaft and the turbine exhaust case as follows. See Figure 404 (Sheet 1).

NOTE: Use PWA 86325 Fixture with turbine exhaust cases that are (Pre SB PW4ENG 72-456). Use PWA 86437 Fixture with (Pre or Post SB PW4ENG 72-456) turbine exhaust cases.

(a) Install inner slide (404/5) in ID of No. 4 bearing retaining plate and secure with eight detail screws (404/1).

(b) Install outer slide (404/4) over inner slide, locating slot in outer slide over key on inner slide.

(c) Rotate turbine shaft until scallops in flange of outer slide assembly align oil pressure and scavenge tubes protruding from exhaust case flange. Secure outer slide to exhaust case with eight detail bolts (404/2).

(d) Tighten eight cap screws (404/3).

(6) If PWA 88222 Fixture or PWA 86437 Fixture is not installed, install the fixture to the low pressure turbine shaft and the turbine exhaust case. See Figure 404 (Sheet 2).

NOTE: Use PWA 88222 Fixture with (Pre or Post SB PW4ENG 72-456) turbine exhaust cases.

(a) Loosen the locknuts that hold the tube and guide assemblies together and install the fixture to the ID of the turbine exhaust case. The tube assembly detail will mate against the No. 4 bearing retaining plate and the guide assembly detail will mate against the rear inner flange of the exhaust case. Attach the fixture with the captured capscrews of both details.

NOTE: If necessary, turn the LPT rotor to align the holes in the end of the 7th stage disk or LPT shaft, as applicable, with the captured capscrews of the tube assembly detail.

(b) Tighten the capscrews of both details to lock the fixture in position.

(7) Use PWA 85504 Gage to measure low pressure turbine axial position (Dimension A). See Figure 405.

NOTE: Measurement should be an average of at least two measurements, 180 degrees apart.

(a) (Pre SB PW4ENG 72-256) You must remove two screws (405/7) and gage plate (405/8) from the top of the bar if it is there. Put the gage plate and screws in the storage location on the bar.

(b) (Post SB PW4ENG 72-256) Install the gage plate (405/8) on the top of the bar (405/2) with two screws (405/7).

(c) Move the dial indicator and the support block away from the spring-loaded rod (405/4).

(d) Push the spring-loaded flush pin assembly (405/6) into tubular housing and rotate to engage the dowel pin (405/5) in the slot to secure the flush pin.

(e) Find the 1.0 inch (25.400 mm) by 1.5 inch (38.100 mm) slot in the inner front flange of the turbine exhaust case at the 6 and 12 o'clock location.

(f) Put the bar (405/2) between two exhaust case struts and next to one of the slots in the case inner front flange.

(g) Put the gage bar on two rear flanges (inner and outer) of the turbine exhaust case and put the flush pin assembly over the 6th stage LPT disk (405/9). Hold the gage to the case with two bolts (405/3) and nuts (405/1).

(h) Release the rod from the locked position and allow the flush pin to touch the disk. Make sure that the flush pin touches the disk and nut the blade (you can rotate the rotor if necessary).

(i) Zero the dial indicator on the back face of the bar.

(j) Move the slide dial indicator into position over the end of the spring-loaded rod (405/4) to read the turbine running position.

(k) Dimension A must be within the limits specified in Figure 406.

NOTE: Reference 847 is applicable to engines that are Pre SB PW4ENG 72-256. Reference 851 is applicable to engines that are Post SB PW4ENG 72-256.

1 If the indicator reading is zero, Dimension A is at its mean.

a (Reference 847) Mean Dimension A is 12.380 inches (314.452 mm).

b (Reference 851) Mean Dimension A is 12.330 inches (313.182 mm).

2 If the indicator reading is "+", the 6th stage disk is to the rear of Mean Dimension A. You must subtract the indicator reading from the mean dimension.

3 If the indicator reading is "-", the 6th stage disk is forward of Mean Dimension A. You must add the indicator reading to the mean dimension.

(l) Remove the gage and repeat measurement at the opposite slot location.

(m) Remove gage. Record Dimension A.

(8) Measure Dimension B as follows. Refer to Figure 407.

(a) Install PWA 85483 Gage Plate on hub. Use a standard depth micrometer.

(b) Dimension B is the measured dimension (M) minus the thickness (X) of the gaging plate. This thickness is stamped on the tool.

B = M - X

(9) Find the correct spacer classification as follows.

(a) Subtract Dimension A (the value of Dimension A is either positive or negative) and Dimension C from Dimension B. This result equals the correct spacer thickness (Dimension D).

B - A - C = D

(b) Find the correct spacer classification. See Table 401.

NOTE: Turbine shaft spacer class may be changed per 72-53-81, Repair-01. See PW4000 Series CIR, PN 51A357.

Class	Thickness (D)
1	0.550 - 0.555 Inch (13.970 - 14.097 mm)
2	0.555 - 0.560 Inch (14.097 - 14.224 mm)
3	0.560 - 0.565 Inch (14.224 - 14.351 mm)
4	0.565 - 0.570 Inch (14.351 - 14.478 mm)
5	0.570 - 0.575 Inch (14.478 - 14.605 mm)
6	0.575 - 0.580 Inch (14.605 - 14.732 mm)
7	0.580 - 0.585 Inch (14.732 - 14.859 mm)
8	0.585 - 0.590 Inch (14.859 - 14.986 mm)
9	0.590 - 0.595 Inch (14.986 - 15.113 mm)
10	0.595 - 0.600 Inch (15.113 - 15.240 mm)
11	0.600 - 0.605 Inch (15.240 - 15.367 mm)

Spacer Classification Data
Table 401

Class	Thickness (D)
(CONTINUED)	
12	0.605 - 0.610 Inch (15.367 - 15.494 mm)
13	0.610 - 0.615 Inch (15.494 - 15.621 mm)
14	0.615 - 0.620 Inch (15.621 - 15.748 mm)
15	0.620 - 0.625 Inch (15.748 - 15.875 mm)
16	0.625 - 0.630 Inch (15.875 - 16.002 mm)
17	0.630 - 0.635 Inch (16.002 - 16.129 mm)
18	0.635 - 0.640 Inch (16.129 - 16.256 mm)
19	0.640 - 0.645 Inch (16.256 - 16.383 mm)
20	0.645 - 0.650 Inch (16.383 - 16.510 mm)
21	0.650 - 0.655 Inch (16.510 - 16.637 mm)
22	0.655 - 0.660 Inch (16.637 - 16.764 mm)
23	0.660 - 0.665 Inch (16.764 - 16.891 mm)
24	0.665 - 0.670 Inch (16.891 - 17.018 mm)
25	0.670 - 0.675 Inch (17.018 - 17.145 mm)
26	0.675 - 0.680 Inch (17.145 - 17.272 mm)
27	0.680 - 0.685 Inch (17.272 - 17.399 mm)

Spacer Classification Data
Table 401 (Continued)

CAUTION: ENSURE CLASSIFIED SPACER IS INSTALLED ON LPT SHAFT. MISALIGNMENT CAN OCCUR IF SPACER IS NOT PRESENT.

(10) Use PWA 85490 Drift and install spacer on shaft.

(11) Apply Antigalling Compound P06-021 to the external splines of the turbine shaft coupling assembly (called coupling). Cure the compound for five minutes, minimum. Refer to Figure 408.

CAUTION: UNWANTED MATERIAL IN THE NO. 1 AND 2 BEARING SUMP CAUSED AN IN-FLIGHT-SHUTDOWN.

CAUTION: MAKE AN INSPECTION OF THE NO. 1 AND 2 BEARING SUMP AREA BEFORE YOU INSTALL THE COUPLING. USE GLOVES. REMOVE ALL UNWANTED MATERIAL BEFORE YOU INSTALL THE COUPLING. See Figure 409.

(12) Install the coupling as follows. Use PWA 85769 Fixture. See Figure 410, Figure 411, Figure 412 and Figure 413.

NOTE: The fixture is installed on PWA 86604 Transport Stand. See Figure 410.

(a) Install shaft (detail−35) to the end of the LPT shaft. Tighten by hand. See Figure 410.

(b) Install the arm (detail−1) to the adapter (detail−3) and eye (detail−2).

(c) Lift and turn the coupling to the horizontal position.

(d) Apply Engine Oil P03−001 to the seal seat and to the coupling as shown in Figure 412.

(e) Install the coupling into the engine over shaft (detail−35). Align the disassembly vector (DV) marks and engage the splines of the coupling to the LPT shaft and fan hub. See Figure 413.

(f) Remove end cap/lift eye (detail−2) from adapter assembly (detail−3).

(g) Install PWA 101021 Rod into the adapter assembly (detail−3) and turn the rod so that it is attached to the shaft assembly (detail−35).

(h) Use a standard one inch (or equivalent) wrench to turn PWA 101021 Rod until the coupling is installed onto the LPT shaft.

(i) Remove the PWA 101021 Rod, the lift arm assembly (detail−1) and the adapter assembly (detail−3) from the tool.

(j) Install the locator (detail−27) to the front fan hub and tighten by hand.

(k) Install and tighten the two rods (detail−36) to the body.

(l) Install the two hydraulic cylinders (detail−24) and the two spacers (detail−26) over the rods.

(m) Install the cover (detail−7) to the locator (detail−27) and attach with the six bolts (detail−41).

(n) Install the nut (detail−11) to the shaft (detail−35) and tighten by hand.

R (o) Loosen the retainer at the rear of the engine as
R follows:

R 1 If the PWA 86325 or PWA 86437 Fixture is
R installed on the turbine exhaust case, loosen
R the eight cap screws (404/3). See Figure 404
R (Sheet 1).

R 2 If the PWA 88222 Fixture is installed on the
R turbine exhaust case, loosen the eight lock
R nuts (404/6). See Figure 404 (Sheet 2).

(p) Connect the hydraulic hoses to the cylinders and to the PWA 29389 Pump. Operate the pump to install the coupling fully.

(q) Disconnect the pump and hoses. Remove the nut (detail-11), six bolts (detail-41), and the cover (detail-7). Remove the two spacers (detail-26), hydraulic cylinders, and the rods (detail-36). Remove the locator (detail-27) from the fan hub.

(r) Use the hoist and install the adapter (detail-3), arm (detail-1), and eye with the four bolts (detail-4).

(s) Retract the locating pin. Turn the plate (detail-21) to put the plate lugs between the coupling lugs. Release the locating pin.

(t) Remove the tool. Remove the shaft (detail-35).

CAUTION: FOR EACH INSTALLATION, A NEW OR TREATED TURBINE SHAFT NUT MUST BE INSTALLED. NUT MAY BE TREATED PER 72-32-84, REPAIR-01. SEE PW4000 SERIES CIR, PN 51A357.

(13) Apply Antigalling Compound P06-021 to the threads and face of the turbine shaft nut (called nut). Cure the compound for five minutes before assembly. Install the washer to the coupling ID. Apply Antigalling Compound P06-021 to coupling. See Figure 408.

(14) For operators that use the mechanical wrench, install the turbine shaft nut on the LPT shaft as follows. Refer to Figure 414.

NOTE: See the following step to install the turbine shaft nut on the LPT shaft with the hyraulic wrench tooling.

(a) Install the nut on the LPT shaft. Tighten it with your hand.

(b) Install PWA 102460 Adapter or PWA 85299 Adapter in the coupling as follows.

1 Loosen the wing nuts and move the three clamps radially inward.

2 Install the adapter to coupling with the keys of the tool aligned with the slots in the coupling. Adjust the adapter at 3 and 9 o'clock for the attachment of the mechanical wrench.

3 Move the three clamps radially outward to engage the lugs of the coupling. Tighten the wing nuts and secure the clamps.

(c) Install PWA 85300 Torque Wrench into the center of the adapter. With the splines aligned, push the wrench into the nut until the wrench touches the face of the nut.

(d) Use a hoist and install a mechanical wrench on the torque wrench and adapter. Push the mechanical wrench to touch the face of the adapter. Engage the pins of the mechanical wrench with the holes in the torque wrench. See Table 402 for the correct combinations of tools.

PWA Torque Wrench	PWA Holder Adapter	PWA Mechanical Wrench or Torque Multiplier	PWA Pneumatic Multiplier
85300	102460 or 85299	80187	80651 or 45419
85300	102460 or 85299	45418	45419
85300	102460 or 85299	80071	80651 or 45419

Turbine Shaft Nut Installation (Mechanical Wrench) - Table 402

(15) For operators that use the hydraulic wrench, install the turbine shaft nut on the LPT shaft as follows. Refer to Table 403 for the correct combinations of tools. Refer to Figure 414.

(a) Install the nut on the LPT shaft. Tighten it with your hand.

PWA Torque Wrench	PWA Holding Adapter	PWA Hydraulic Wrench	PWA Pump	PWA Cart
85514	85515	33732	28814 or 29510	75046
85514	85515	18872	28814 or 29510	75046 or 28815
85300	102460 or 85299	87354	28814 or 29510	75046
85300	102460 or 85299	80070	28814 or 29510	75046

Turbine Shaft Nut Installation − (Hydraulic Wrench) − Table 403

(b) (Method 1)

1 Attach PWA 85515 Adapter to a hydraulic wrench. Install the adapter/wrench in the coupling. Lock the detail clamps behind the lugs in the coupling.

2 Install PWA 85514 Torque Wrench in the adapter, engaging the splines of the torque wrench with the splines in the coupling and the hydraulic wrench.

3 Connect a pump to the hydraulic wrench.

(c) (Method 2)

1 Install PWA 102460 Adapter or PWA 85299 Adapter in the coupling, the detail keys in the slots of the coupling. With the three detail clamps to the rear of the slots in the coupling, tighten the clamps.

2 Install PWA 85300 Torque Wrench in the center of the adapter, engaging the splines of the nut.

3 Push the torque wrench until it touches the face of the nut.

4 With a hoist, lift a hydraulic wrench and install it on the torque wrench, engaging splines. Engage the pins of the hydraulic wrench in the holes of the adapter.

5 Connect a pump to the hydraulic wrench.

(16) (Reference 971) Tighten the turbine shaft nut with the wrench as follows.

(a) Tighten nut to 5000 − 7000 lb−in. (564.924 − 790.894 N.m). Turn the nut through an angle of 43 − 47 degrees. Loosen the nut (to zero).

(b) Tighten the nut to 4000 − 6000 lb−in. (451.939 − 677.909 N.m).

(c) Find a reference point on the nut and an adjacent part.

(d) Turn the nut through an angle of 43 − 47 degrees.

(e) Loosen the nut (to zero) and do step (b) again.

(f) If the nut reference point is aligned with adjacent part reference point or beyond it within two degrees maximum, apply final angle of turn by step (d).

(g) If reference points are not within limits, do steps (c), (d) and (e) again, in order, until reference points are within limits. Then do step (f).

(17) Remove the tools from the coupling.

(18) (Reference 1008) Measure Dimension AL from the front face of the hub to the front face of the coupling. See Figure 402 (Sheet 2).

R
R

(a) Measured Dimension AL must not be more than calculated Dimension AL plus 0.003 inch (0.076 mm) nor less than calculated Dimension AL minus 0.003 inch (0.076 mm).

Measured AL <= Calculated AL + 0.003 inch (0.076 mm) AND
Measured AL >= Calculated AL − 0.003 inch (0.076 mm)

NOTE: See step (4) for Calculated Dimension AL.

(b) If Measured Dimension AL is not within limits, remove the nut and do this procedure again until measured Dimension AL is within limits.

(19) Make sure that turbine shaft spacer is seated.

(20) (References 847 and 851) Do a check of the low pressure turbine axial position as follows.

(a) Use PWA 85504 Gage. If the engine is Pre SB PW4ENG 72−256, do not use the detail gage plate. If the engine is Post SB PW4ENG 72−256, use the detail gage plate.

(b) The reading on the indicator must be between minus 0.025 inch (0.635 mm) and plus 0.025 inch (0.635 mm). If it is not, replace the spacer as necessary.

NOTE: If the indicator reading is outside of the limits and is "+", a thinner spacer is necessary. If the reading is outside of the limits and is "−", a thicker spacer is necessary.

(21) Install the key washer and the retaining ring to hold the turbine shaft nut. See Figure 415.

(22) At the rear of the engine, remove the 16 tool bolts that attach the PWA 86437 Fixture, or PWA 86325 Fixture to the exhaust case and the LPT shaft, if used. See Figure 404 (Sheet 1). If PWA 88222 Fixture was used, loosen the captured capscrews on the tube assembly detail and the guide assembly detail. See Figure 404 (Sheet 2). Remove the retainer fixture from the turbine exhaust case.

(23) For operators that use a mechanical wrench, install the turbine shaft (coupling/retaining) nut (called nut) tooling as follows.

NOTE: See the following step to install the turbine shaft (coupling/retaining) nut (called nut) with the hyraulic wrench tooling.

CAUTION: YOU MUST TREAT THE NUT EACH TIME YOU INSTALL IT.

(a) Apply Anti-Seize Paste P06-054 to the nut. Remove the unwanted paste. Refer to Figure 408.

(b) Install the nut on the hub. Tighten it with your hand.

(c) Install PWA 85301 Adapter into the coupling. See Figure 417.

1 Slide the three "L" shaped clamps toward the centerline of the adapter.

2 Install the adapter into the coupling with the inner slotted flange engaged with the slots on the coupling. Move the "L" shaped clamps outward and tighten the wing nuts.

(d) Install PWA 85302 Torque Wrench into the nut.

1 Move the wrench over the adapter and turn the wrench to engage the slots in the nut.

2 Move the clamps radially outward to engage the grooves in the nut. Install the wrench so that the wrench holes are at the 3 and 9 o'clock locations.

3 Keep the wrench in position with the three wing nuts.

(e) Use a hoist and install PWA 29614 Mechanical Wrench over the adapter. Engage the splines of the torque wrench.

(f) Install PWA 29615 Holder on the mechanical wrench. Engage the pins of the mechanical wrench with the holes in the holder.

(g) Install either PWA 45419 Pneumatic Multiplier or PWA 80651 Pneumatic Multiplier on the mechanical wrench.

(24) For operators that use the hydraulic wrench to install the turbine shaft (coupling/retaining) nut (called nut), install tooling as follows.

CAUTION: YOU MUST TREAT THE NUT EACH TIME YOU INSTALL IT.

(a) Apply Anti-Seize Paste P06-054 to the nut. Remove the unwanted paste. Refer to Figure 408.

(b) Install the nut on the hub. Tighten it with your hand.

(c) Install PWA 85507 Adapter into the coupling. See Figure 418.

1 Slide three wing nuts toward adapter centerline.

2 Place adapter into front end of coupling until keys locate slots of coupling. Slide clamps outward and secure.

(d) Install PWA 85508 Torque Wrench and PWA 25000 Hydraulic Wrench.

1 With a hoist, remove the hydraulic wrench from PWA 28669 Cart.

2 Attach torque wrench to the hydraulic wrench and install both as a unit over adapter using hoist and nylon strap.

3 Engage teeth of torque wrench with slots in nut. Align splines of adapter with splines in hydraulic wrench.

4 Attach either PWA 28668 Pump or PWA 29510 Pump to the hydraulic wrench.

(25) (Reference 970) Tighten the turbine shaft (coupling/retaining) nut with the wrench as follows.

(a) Tighten the nut to 24,200 - 26,800 lb-in. (2734.232 - 3027.993 N.m). Turn the nut through an angle of 18 - 20 degrees. Loosen the nut (to zero).

(b) Tighten the nut to 24,200 - 26,800 lb-in. (2734.232 - 3027.993 N.m).

(c) Find a reference point between the nut and an adjacent part.

(d) Turn the nut through an angle of 18 - 20 degrees.

(e) Loosen the nut (to zero) and do step (b) again.

(f) If the nut reference point is in line with the adjacent part reference point or beyond it within two degrees maximum, apply final angle of turn per step (d). If necessary, tighten nut three degrees maximum to align locking feature.

(g) If reference points are not within limits, repeat steps (c), (d) and (e) in order, until reference points are within limits. Then perform step (f).

(26) Remove the tooling from the coupling.

(27) Install a new packing, lubricated with Petrolatum White P06-002, to the turbine shaft plug. Install the plug to the coupling ID and secure with a key washer and a retaining ring. See Figure 416.

NOTE: Make sure retaining ring is fully inserted in the retaining nut groove, all around, and ring end gap is 0.010 inch (0.254 mm) minimum.

(28) Attach the No. 4 bearing retaining plate to the turbine exhaust case with the eight bolts lubricated with Engine Oil P03-001 and key washers PN MS 9276-10. Torque the bolts to 75 - 85 lb-in. (8.474 - 9.604 N.m). Bend the key washer tabs against the bolthead flats. See Figure 419.

(29) Install No. 4 bearing oil scavenge (inner) tube. See Figure 420.

(a) Remove protective cover from the mount pad recess in turbine exhaust case rear inner diameter.

(b) Install new gasket (420/3) in groove in recess in exhaust case rear inner diameter.

(c) Align boltholes in flange of No. 4 bearing oil scavenge tube (420/8) with boltholes in recessed mount pad in exhaust case rear inner diameter. Align bolthole in detail tube bracket with bolthole in exhaust case rear inner diameter. Secure tube using three bolts (420/6) lubricated with Engine Oil P03-001 and key washers (420/7). Torque bolts to 32 - 36 lb-in. (3.616 - 4.067 N.m). Bend tabs of key washers.

(30) (Pre SB PW4ENG 72-472) Install the No. 4 bearing (oil) nozzle and the No. 4 bearing packing transfer tube in the exhaust case No. 4 bearing compartment at the 1:30 o'clock position. See Figure 421.

(a) Install the nozzle (421/4) in the exhaust case and secure with key washers (421/2 and (421/3) and bolts (421/1). Bend the tabs on the key washers.

(b) Install the No. 4 bearing packing transfer tube (421/5) to the No. 4 bearing nozzle (421/4) and secure with key washers (421/6 and 421/7) and bolts (421/8). Bend the tabs on the key washers.

(31) (Post SB PW4ENG 72-472) Install No. 4 bearing (oil) nozzle and No. 4 bearing damper supply tube. See Figure 422 (Sheet 1) and (Sheet 2).

(a) Install the No. 4 bearing nozzle (422/11) in the port in the pad on the exhaust case rear inner diameter at the 1:30 o'clock position. Install the nozzle with two bolts (422/16) and (422/17), with threads lubricated with Engine Oil P03-001, and two washers (422/16) and (422/17).

(b) Install the No. 4 bearing damper supply tube (422/12) through the 0.380 inch (9.652 mm) diameter hole in the nozzle (422/11) and into the port in the exhaust case rear flange. Install the damper tube with two bolts (422/16) and (422/17) with threads lubricated with Engine Oil P03-001, and washers (422/16) and (422/17). Torque the bolts that attach the nozzle to the exhaust case and bolts that attach the damper supply tube to the nozzle to 75 - 85 lb-in. (8.474 - 9.604 N.m). Bend the tabs of washers.

(32) (Post SB PW4ENG 72-472) Install No. 4 bearing front nozzle assembly and the packing transfer tube (damper tube to front nozzle). See Figure 422.

(a) Lubricate two packings (422/14) with Engine Oil P03-001. Install the packings in the grooves of the packing transfer tube (422/15). Insert one end of the tube into the port in the front No. 4 bearing nozzle (422/13).

(b) Align the boltholes in the flange of the front nozzle with the two retainer plate boltholes at the 12 o'clock position; and insert the nozzle through the hole in the No. 4 bearing support flange at the 1:30 o'clock position. Insert the end of the transfer tube in the port in the elbow of the No. 4 bearing damper supply tube. Put the retaining plate (422/2), chamfered side out, on the retainer plate pad (under the nozzle flange). Put the key washer (422/1) over the oil nozzle flange, and install two bolts, with threads lubricated with Engine Oil P03-001.

(c) (Reference 90) Make sure that the clearance gap (422/3) between the retaining plate and the grooves in the bearing outer race is in the limit specified in Index 2, Figure 423. Torque the bolts that attach the retainer plate to 75 - 85 lb-in. (8.474 - 9.604 N.m). Bend the tabs of washer (422/1).

CAUTION: YOU MUST APPLY ENGINE OIL FULLY TO THE COVER PACKING OR YOU WILL CUT THE PACKING DURING INSTALLATION. A CUT PACKING WILL CAUSE SUBSEQUENT OIL LOSS AND CAN CAUSE AN IN-FLIGHT SHUTDOWN.

CAUTION: INSTALL THE COVER INTO POSITION USING FOUR WORK BOLTS EQUALLY SPACED AROUND THE COVER. TIGHTEN THE BOLTS EQUALLY IN SMALL INCREMENTS TO PULL THE COVER INTO POSITION EQUALLY. MONITOR THE ENGAGEMENT OF THE COVER TO MAKE SURE THAT THE PACKING IS NOT CUT DURING INSTALLATION. A CUT PACKING WILL CAUSE SUBSEQUENT OIL LOSS AND CAN CAUSE AN IN-FLIGHT SHUTDOWN.

(33) Install the No. 4 bearing cover as follows: See Figure 424.

(a) Apply Engine Oil P03-001 fully to the new packing (424/2).

(b) Install the new packing into the groove at the rear flange of the No. 4 bearing cover (424/3).

(c) Install the cover into the rear inner flange of the exhaust case (424/1).

(d) Install 4 work bolts equally spaced around the cover.

(e) Tighten the bolts equally in small increments to pull the cover into position equally.

(f) Monitor the engagement of the cover to make sure the packing is not cut.

(g) Remove the work bolts.

(34) Install the No. 4 bearing heat shield (424/4) into recess in the No. 4 bearing shield (424/5). Align bolt holes and install shield over No. 4 bearing cover at the rear inner flange of the exhaust case. Install the shield with 30 bolts, lubricated with Engine Oil P03-001. Torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(35) (Post SB PW4ENG 79-76) Install No. 4 bearing (oil) pressure tube. See Figure 425 (Sheet 1) and (Sheet 2).

(a) Remove protective cover from adapter (425/5).

NOTE: The No. 4 bearing (oil) pressure tube of (Pre SB PW4ENG 79-76) would not have been removed for split-shipment.

(b) No. 4 bearing pressure tube option to prevent possible wear to the No. 4 bearing pressure tube (425/14), a fiberglass tape wear Wrap P05-136, (425/17) is provided as an option.

(c) Install the shield set (425/15) and the heat shield insulation slide clamp (425/16) on the elliptical section of the No. 4 scavenge tube (425/14).

NOTE: The shield is installed on the section of the tube that goes through the strut of the turbine exhaust case.

(d) Install the shield set (425/7) on the No. 4 pressure tube as follows.

1 Place the two halves over the round section of tube.

2 Install one restraining strap (425/18) through the loops on the section of the shield that overlaps the shield set (425/15).

3 Make tight the shield set on the tube by pulling the strap tight. Cut off excess strap material.

4 Put the loop clamp (425/10) on the wear sleeve of the shield set and secure temporarily with a work bolt and nut.

(e) Attach bracket (425/11) to the turbine exhaust case with two bolts (425/8). Torque the bolts to 75 − 85 lb−in. (8.474 − 9.604 N.m).

(f) Install the No. 4 pressure tube through the strut at the 4:30 o'clock position.

1 Attach the tube nut to the adapter (425/5), handtight.

NOTE: The shield may be separated to attach the tube nut to the adapter.

2 Remove the work bolt and replace with bolt (425/9) and nut (425/12) and attach to the bracket (425/11).

3 Torque the tube nut to the adapter (425/5) to 225 − 250 lb−in. (25.422 − 28.246 N.m). Safety the tube nut with lockwire.

R
R

4 Torque the bolt (425/9) that attaches the clamp (425/10) to the bracket (425/11) to 32 - 36 lb-in. (3.616 - 4.067 N.m).

5 Install the four additional straps (425/18) to hold the shield in place.

6 Make tight the shield set on the tube by pulling the straps tight. Cut off excess strap material.

7 Install bracket (425/2) over the outboard end of the tube.

8 Position the nut (425/4) on the outboard end of the tube and secure the nut to the tube with thrust wire (425/19).

9 Attach the tube shield (425/3) to the turbine exhaust case at the 4:30 o'clock position, pushing it on over the nut (425/4). Line up the shield with the bracket (425/2).

10 Install two bolts (425/1) to retain shield and bracket and torque to 32 - 36 lb-in. (3.616 - 4.067 N.m). Safety the bolts with lockwire.

D. Postrequisites

(1) Do a vacuum check of the No. 1, 1.5, and 2 bearing compartments. Refer to 72-00-32, Testing-01 (Task 72-00-32-790-001).

(2) Airflow check No. 4 bearing oil nozzle. Refer to 72-54-00, Assembly-01 (Task 72-54-00-400-001).

(3) Install all stage 1 LPC blade assemblies. See 72-00-31, Installation-04 (Task 72-00-31-420-002-002).

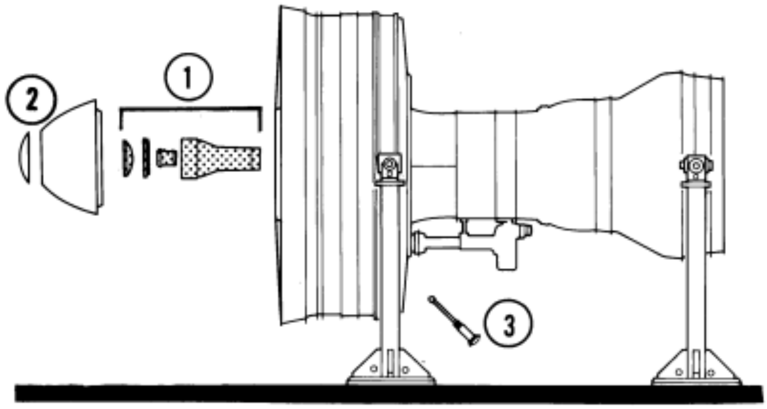
NOTE: If blades were not removed during coupling removal procedure, then shims should be taken out at this time.

(4) Install compressor inlet cone. See 72-00-31, Installation-02 (Task 72-00-31-420-001).

(5) Install electronic engine control (EEC) speed transducer (N1). See 72-00-34, Installation-03 (Task 72-00-34-450-001).

(6) Test the engine. Refer to the Test Reference Table. Refer to 71−00−00, Testing−00 (Task 71−00−00−990−003).

ENGINE GENERAL − LPC/LPT COUPLING − INSTALLATION−01



1. INSTALL LPC/LPT COUPLING.
2. INSTALL COMPRESSOR INLET CONE.
3. INSTALL ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).

ENGINE GENERAL − LPC/LPT COUPLING − INSTALLATION−02

Task 72−00−32−420−001−002:

1. Install The LPC/LPT Coupling (Front Compressor Drive Turbine Shaft Installed (Hydraulic Wrench) − Deleted

A. Procedure

(1) This procedure is relocated to 72−00−32, Installation−01 (Task 72−00−32−420−001).

Task 72-00-32-430-001:

1. Install No. 1.5 Bearing And Seal

A. Equipment And Materials Necessary

Special Tools:

PWA 18872	Wrench, Hydraulic*
PWA 28814	Pump, Hydraulic* (Use With Hydraulic Wrench)
PWA 28815	Cart, Storage (Optional)* (Use With Hydraulic Wrench)
PWA 29510	Pump, Hydraulic (Hand)* (Use With Hydraulic Wrench)
PWA 33732	Wrench, Hydraulic*
PWA 45418	Wrench, Mechanical*
PWA 45419	Air Torque Multiplier* (Use With Mechanical Wrench)
PWA 75046	Cart (Optional)* (Use With Hydraulic Wrench)
PWA 76154	Adapter
PWA 80070	Wrench, Hydraulic*
PWA 80071	Multiplier, Torque* (Use With Mechanical Wrench)
PWA 80187	Wrench, Mechanical*
PWA 80651	Multiplier, Pneumatic* (Use With Mechanical Wrench)
PWA 85261	Adapter
PWA 85262	Guide, Piloting
PWA 85263	Drift
PWA 85264	Adapter, Holding* (Use With Mechanical And Hydraulic Wrenches)
PWA 85265	Wrench, Torque* (Use With Mechanical And Hydraulic Wrenches)
PWA 85375	Plate, Anchor* (Use With Mechanical Wrench)
PWA 85468	Stand
PWA 85516	Wrench, Torque* (Use With Hydraulic Wrench)
PWA 85517	Adapter, Holding* (Use With Hydraulic Wrench)
PWA 87354	Wrench, Hydraulic*
PWA 88100	Plate, Anchor* (Use With Mechanical And Hydraulic Wrenches)

*See Table 401 for Mechanical Wrench or Table 402 for Hydraulic Wrench tool options. These tables show the correct combinations of tools for the installation of the No. 1.5 bearing (inner race) retaining nut.

ENGINE GENERAL − LPC/LPT COUPLING − INSTALLATION−03

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)

B. Procedure

(1) Install bearing outer race.

(a) Position bracket to front face of outer race aligning dowel pins with dowel pin holes in flange.

NOTE: Front face of bearing outer race is adjacent to chamfer on ID.

(b) Position and install outer race and bracket to No. 1 1/2 bearing support aligning dowel pins of bracket with dowel pin holes in support flange.

(c) (Post SB PW4ENG 72−253) Install bolts and key washers through bearing outer race as follows. See Figure 401.

1 Install fourteen (14) bolts with seven (7) double key washers.

2 Install two (2) longer bolts with key washers at bracket location.

3 (Reference 981) Tighten two adjacent bolts and then the opposite bolts until all bolts are tight and the outer race is installed in the support. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

4 Bend the key washers to safety the bolt.

(2) Heat the No. 1.5 bearing inner race and rollers. See Standard Practices Manual, PN 585005.

(3) Install PWA 85261 Adapter to coupling. Attach PWA 76154 Adapter to suitable sling to lift and/or trunnion coupling. Position coupling on PWA 85468 Stand front end down. See Figure 402.

ENGINE GENERAL − LPC/LPT COUPLING − INSTALLATION−03

(4) Install the bearing inner race and rollers on the coupling. Do the procedure that follows as quickly as possible. See Figure 403.

(a) With correct gloves, position the heated No. 1.5 bearing on the coupling (mating mark up).

(b) Install PWA 85263 Drift to pilot on rod of guide on coupling. Drift bearing to seat on coupling.

(c) Leave the drift on the bearing until it cools to 75° − 85°F (23.9° − 29.4°C).

(d) Remove drift from coupling.

(e) Make sure the inner race of the bearing has cooled to 75° − 85°F (23.9° − 29.4°C) before you continue with the assembly procedure.

(5) Install seal seat over coupling with "REAR" up and butt against bearing. See Figure 404.

CAUTION: FOR EACH ENGINE BUILD, IT WILL BE NECESSARY TO INSTALL A NEW OR REFURBISHED NO. 1.5 BEARING (INNER RACE) RETAINING NUT OR DAMAGE TO MATING PARTS CAN OCCUR. NUT MAY BE REFURBISHED PER PW4000 SERIES CIR, PN 51A357.

(6) Install the No. 1.5 bearing (inner race) retaining nut (called nut) on the coupling as follows.

(a) Apply Engine Oil P03−001 to the nut.

(b) Install the nut on the coupling. Tighten the nut with your fingers.

(7) For operators that use a mechanical wrench to install the nut, install tooling as follows. See Table 401 for the correct combinations of tools.

PWA Torque Wrench	PWA Holding Adapter	PWA Mechanical Wrench or Torque Multiplier	PWA Pneumatic Multiplier	PWA Anchor Plate
85265	85264	80187	80651 or 45419	88100 or 85375
85265	85264	45418	45419	88100 or 85375

Retaining Nut Installation (Mechanical Wrench)
Table 401

PWA Torque Wrench	PWA Holding Adapter	PWA Mechanical Wrench or Torque Multiplier	PWA Pneumatic Multiplier	PWA Anchor Plate
85265	85264	80071	80651 or 45419	88100

Retaining Nut Installation (Mechanical Wrench)
Table 401 (Continued)

(a) Install PWA 85264 Adapter in the coupling, aligning splines.

(b) Install PWA 85265 Torque Wrench on coupling, aligning slots in wrench with slots in retaining nut.

(c) Install a mechanical wrench on the adapter.

(d) Install an anchor plate on the adapter, engaging the pins on the mechanical wrench with the holes in the anchor plate.

(e) If you want, install a pneumatic multiplier on the mechanical wrench.

(8) For operators that use a hydraulic wrench to install the nut, install tooling as follows. See Table 402 for the correct combinations of tools.

(a) (Method 1) See Figure 405 (Sheet 1).

1 Install PWA 85517 Adapter in the rear of the coupling, large end first.

2 Install PWA 85516 Wrench over the adapter and engage the teeth of the wrench in the slots of the nut.

3 With a hoist, remove a hydraulic wrench from the cart. Install the hydraulic wrench on the adapter.

4 Attach a pump to the hydraulic wrench.

ENGINE GENERAL - LPC/LPT COUPLING - INSTALLATION-03

PWA Torque Wrench	PWA Holding Adapter	PWA Hydraulic Wrench	PWA Anchor Plate	PWA Pump	PWA Cart
85516	85517	33732	-----	28814 or 29510	75046
85516	85517	18872	-----	28814 or 29510	75046 or 28815
85265	85264	87354	88100	28814 or 29510	75046
85265	85264	80070	88100	28814 or 29510	75046

Retaining Nut Installation (Hydraulic Wrench)
Table 402

(b) (Method 2) See Figure 405 (Sheet 2).

1 Install PWA 85264 Adapter in the rear of the coupling, large end first.

2 Install PWA 85265 Torque Wrench over the adapter and engage the teeth of the wrench in the slots of the nut.

3 With a hoist, lift a hydraulic wrench from a cart. Install a hydraulic wrench on the torque wrench.

4 Install PWA 88100 Anchor Plate on the adapter. Engage the holes of the anchor plate with the pins of the hydraulic wrench.

5 Connect a pump to the hydraulic wrench.

CAUTION: NO. 1.5 BEARING (INNER RACE) RETAINING NUT MUST BE REFURBISHED AFTER EACH COMPLETE TORQUE APPLICATION SPECIFIED IN THE FOLLOWING STEPS.

(9) (Reference 972) Torque nut as follows:

(a) Tighten nut to 2200 - 2800 lb-in. (248.567 -
R 316.357 N.m). Turn nut through angle of 11 - 12
R degrees 12 minutes and loosen nut to zero.

(b) Tighten nut to 2200 - 2800 lb-in. (248.567 - 316.357 N.m).

ENGINE GENERAL − LPC/LPT COUPLING − INSTALLATION−03

(c) Establish common reference points between nut and its mating part.

R (d) Turn nut through angle of 11 − 12 degrees 12
R minutes.

(e) Loosen nut to zero and repeat step (b).

(f) If nut reference point is in line with mating part reference point or beyond it within 2 degrees maximum, apply final angle of turn per step (d).

(g) If reference points are not within limits, repeat steps (c), (d) and (e) in order until reference points are within limits. Then perform step (f).

(10) Remove tooling from coupling.

(11) Check, with a 0.001 inch (0.025 mm) feeler gage, that the seal seat and bearing are correctly seated on the coupling. The seal seat and bearing are correctly seated if you are unable to fit the 0.001 inch (0.025 mm) feeler gage between the coupling shoulder, bearing and seal seat.

(12) Install key washer to nut and coupling. Install retaining ring to secure key washer.

(13) Install protector around bearing and seal seat.

C. Postrequisites

(1) Install The LPC/LPT Coupling (With The Front Compressor Drive Turbine Shaft Installed). Refer to 73−00−32, Installation−01 (Task 72−00−32−420−001).

ENGINE GENERAL - LPC/LPT COUPLING - INSTALLATION-04

Task 72-00-32-430-001-002:

1. Install The No. 1.5 Bearing And Seal (Hydraulic Method) - Deleted

    A. Procedure

        (1) This procedure is relocated to 72-00-32, Installation-03 (Task 72-00-32-430-001).

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72-00-32-420-005:

1. Install The LPT/LPC Coupling (With The Front Compressor Drive Turbine Shaft Removed)

NOTE: See Figure 401 for Part/Assembly Installation Procedure Sequence.

A. Prerequisites

(1) See Inspection/Check-01 (Task 72-00-32-990-001) for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by reference number. For example: (Reference 1234) Torque retaining nut as follows.

(2) If removed, Install The No. 1.5 Bearing And Seal. Refer to 72-00-32, Installation-03 (Task 72-00-32-430-001).

B. Equipment And Materials Necessary

Special Tools:

PWA 3755	Pump, Hydraulic
PWA 25000	Wrench, Hydraulic
PWA 28668	Pump, Hydraulic (Use With Hydraulic Wrench)
PWA 28669	Cart (Optional) (Use With Hydraulic Wrench)
PWA 29389	Pump, Hydraulic
PWA 29510	Pump, Hydraulic (Hand) (Use With Hydraulic Wrench)
PWA 29614	Wrench, Mechanical
PWA 29615	Holder, Plate (Use With Mechanical Wrench)
PWA 45419	Air Torque Multiplier (Use With Mechanical Wrench)
PWA 80651	Multiplier, Pneumatic (Use With Mechanical Wrench)
PWA 85301	Adapter, Holding (Use With Mechanical Wrench)
PWA 85302	Wrench, Torque (Use With Mechanical Wrench)
PWA 85507	Adapter, Holding (Use With Hydraulic Wrench)
PWA 85508	Wrench, Torque (Use With Hydraulic Wrench)
PWA 85769	Fixture, Install/Remove
PWA 86604	Stand, Transport

R
R

ENGINE GENERAL − LPC/LPT COUPLING − INSTALLATION−05

Consumable Materials:

	Item No.	Designation
	P03−001	Oil, Engine (PWA 521B)
R	P06−002	Petrolatum, White (PMC 9609)
	P06−021	Compound, Antigalling (PWA 550−3)
R	P06−054	Paste, Antiseize (PWA 36246)

C. Procedure
See Figure 402.

(1) Measure Dimension AJ on the front compressor hub assembly (called hub) and Dimension AK on the turbine shaft coupling assembly (called coupling). Write these dimensions. See Figure 403.

(2) Calculate Dimension AL as follows: Subtract Dimension AK from Dimension AJ. Write Dimension AL.

$$AL = AJ - AK$$

(3) Apply Antigalling Compound P06−021 to the external splines of the coupling. Cure the compound for five minutes, minimum. Apply Engine Oil P03−001 to the areas of the coupling shown in the figure. See Figure 404.

(4) Install PWA 85769 Fixture in the coupling as follows. See Figure 405 and Figure 406.

NOTE: The fixture is installed on PWA 86604 Transport Stand. See Figure 405.

(a) With the coupling front end up on a work bench, install the assembly of the detail body, locating plate, and detail−36 rods. The lugs on the locating plate must be aligned with the slots in the ID of the coupling.

(b) Pull back the detail dowel pin and turn the detail locating plate until the lugs on the plate are behind the lugs that are in the ID of the coupling. Release the pin to lock the locating plate in position.

(c) Attach the detail−9 adapter to the detail locating plate.

(d) Attach the detail−3 adapter, detail arm, and detail eye bolt to the tools on the coupling.

(e) Lift the tool and coupling with a hoist. Trunnion the assembly to a horizontal position.

CAUTION: UNWANTED MATERIAL IN THE NO. 1 AND 2 BEARING SUMP CAUSED AN IN−FLIGHT−SHUTDOWN.

CAUTION: MAKE AN INSPECTION OF THE NO. 1 AND 2 BEARING SUMP AREA BEFORE YOU INSTALL THE COUPLING. USE GLOVES. REMOVE ALL UNWANTED MATERIAL BEFORE YOU INSTALL THE COUPlING. See Figure 407.

(5) Install the coupling in the engine as follows.

(a) With the splines on the coupling aligned with the splines in the ID of the hub, install the coupling in the engine until it does not go in any further.

1 With a borescope through the N1 speed transducer hole, make sure that the balls of the No. 1.5 bearing are to the rear of the chamfer on the No. 1.5 bearing outer race. See Figure 408.

NOTE: The N1 transducer boss is at 5 o'clock on the intermediate case.

(b) Remove the fixture's detail eye bolt, detail−3 adapter, and detail arm.

(c) Install the detail locator in the hub. Turn the locator in the threads in the ID of the hub until it cannot turn any more.

(d) Install the two detail hydraulic cylinders and detail spacers on the detail rods.

(e) Attach the detail cover to the detail locator with the three detail screws.

(f) Attach the hydraulic hose assembly and PWA 29389 Pump or PWA 3755 Pump to the hydraulic cylinders.

(g) Operate the pump to make the shoulder of the coupling touch the shoulder in the ID of the hub.

R
R

(h) Remove the fixture from the coupling.

(6) (Reference 1008) Measure Dimension AL from the front face of the hub to the front face of the coupling. See Figure 403.

(a) Measured Dimension AL must not be more than Calculated Dimension AL plus 0.003 inch (0.076 mm) nor less than Calculated Dimension AL minus 0.003 inch (0.076 mm).

Measured AL <= Calculated AL + 0.003 inch (0.076 mm) AND
Measured AL >= Calculated AL − 0.003 inch (0.076 mm)

(b) If Measured Dimension AL is not within limits, it is necessary to install the coupling again.

R (7) Apply Antiseize Paste P06−054 to the turbine shaft (coupling/retaining) nut (called nut) in the area shown
R on Figure 407. Apply Antiseize Paste P06−054 to the
R hub in the area shown on Figure 409. Remove unwanted
R paste.

(8) For operators that use the mechanical wrench, install the nut in the hub as follows.

(a) Install the nut in the hub. Tighten it with your hand.

(b) Install PWA 85301 Adapter in the coupling as follows. See Figure 410.

1 Move the three detail clamps toward the center of the adapter.

2 Install the adapter in the coupling. Engage the keys of the adapter in the inner slots of the coupling. Move the clamps outward behind the lugs of the coupling and tighten them.

(c) Install PWA 85302 Wrench in the nut as follows.

1 Install the wrench over the adapter. Engage the keys of the wrench in the slots of the nut.

2 Move the detail clamps outward to engage the groove in the nut. Tighten the clamps.

(d) Lift PWA 29614 Mechanical Wrench with a hoist. Install the mechanical wrench on the adapter.

(e) Install PWA 29615 Holder on the mechanical wrench. Engage the pins of the mechanical wrench with the holes in the holder.

(f) If you want, install either PWA 80651 or PWA 45419 Pneumatic Multiplier on the mechanical wrench.

(9) For operators that use the hydraulic wrench, install the nut in the hub as follows.

(a) Install the nut in the hub and tighten it with your hand.

(b) Install a PWA 85507 Adapter in the coupling as follows. See Figure 411.

1 Move the three detail clamps toward the center of the adapter.

2 Install the adapter in the coupling.

3 Engage the keys of the adapter in the inner slots of the coupling.

4 Move the clamps outward behind the lugs of the coupling and tighten them.

(c) Install PWA 85508 Torque Wrench in the nut as follows.

1 With a hoist, remove PWA 25000 Hydraulic Wrench from PWA 28669 Cart.

2 Attach the torque wrench to the hydraulic wrench.

3 Engage the teeth of the torque wrench with the slots of the nut.

4 Align the splines of the hydraulic wrench with the splines of the adapter.

5 Attach either PWA 28668 or PWA 29510 Pump to the hydraulic wrench.

(10) (Reference 970) Tighten the nut as follows.

(a) Tighten the nut to 24,200 - 26,800 lb-in. (2734.232 - 3027.993 N.m). Turn the nut through an angle of 18 - 20 degrees. Loosen the nut to zero.

(b) Tighten the nut to 24,200 - 26,800 lb-in. (2734.232 - 3027.993 N.m).

(c) Find a reference point between the nut and an adjacent part.

(d) Turn the nut through an angle of 18 - 20 degrees.

(e) Loosen the nut to zero. Do step (b) again.

(f) If the nut reference point is in line with the adjacent part reference point, or beyond it within two degrees maximum, do step (d) again. If necessary, tighten the nut three degrees maximum to align the locking features.

(g) If the reference points are not within limits, do steps (c), (d) and (e) again, in that order, until the reference points are within limits. Then do step (f).

(11) Remove the tools from the coupling.

D. Postrequisites

(1) Do a vacuum check of the No. 1, 1.5, and 2 bearing compartments. Refer to Testing-01 (Task 72-00-32-790-001).

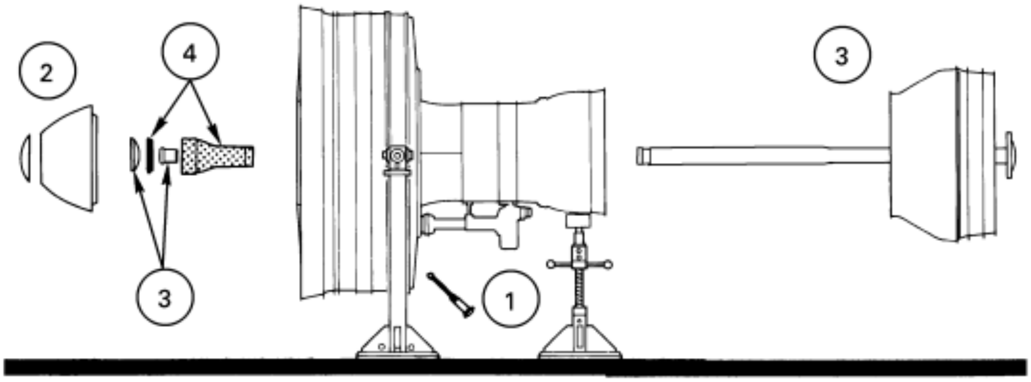
(2) Install The Low Pressure Turbine And Turbine Exhaust Case With The Shaft. Refer to 72-00-53, Installation-08 (Task 72-00-53-420-002).

(3) If not installed, install all Stage 1 LPC blade assemblies. Refer to 72-00-31, Installation-04 (Task 72-00-31-420-002-002). If the blades are installed, remove the shims that are under the tips of the lower fan blades.

(4) Install The Compressor Inlet Cone. Refer to 72-00-31, Installation-02 (Task 72-00-31-420-001).

(5) Install The Electronic Engine Control (EEC) Speed Transducer (N1). Refer to 72−00−34, Installation−03 (Task 72−00−34−450−001) or the EEC speed transducer (N1) multiplexer input probe, 72−00−34, Installation−17 (Task 72−00−34−450−013) as applicable.

(6) Test the engine. Refer to the Test Reference Table per 71−00−00, Testing−00 (Task 71−00−00−990−003).



1. REMOVE ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).
2. REMOVE COMPRESSOR INLET CONE.
3. REMOVE THE LOW PRESSURE TURBINE AND TURBINE EXHAUST CASE WITH THE SHAFT.
4. REMOVE LPC/LPT COUPLING.

ENGINE GENERAL - LPC/LPT COUPLING - INSTALLATION-06

Task 72-00-32-420-005-002:

1. Install The LPT/LPC Coupling (With The Front Compressor Drive Turbine Shaft Removed) (Hydraulic Wrench) - Deleted

A. Procedure

(1) This procedure is relocated to 72-00-32, Installation-05 (Task 72-00-32-420-005).

Previous Pageblock Return to Previous Menu Next Pageblock

ENGINE GENERAL - LPC/LPT COUPLING - INSPECTION/CHECK-01

Task 72-00-32-990-001:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B or C located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.

C. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits

(1) Limits applicable to any combination of new or used parts.

(a) This column provides the acceptable (minimum − maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.

(b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.

(c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	I F R	Description	New Part Reference Dimensions Min		Limits Min	
			Min	Max	Min	Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (13.131)	(−)	0.512 (13.005)	=	.005 (0.126)
0.527 (13.385)	(−)	0.508 (12.903)	=	.019 (0.482)

EXAMPLE 2

Ref. No.	I F R	Description	New Part Reference Dimensions		Limits	
			Min	Max	Min	Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets andlines may be provided.See Example 3.These enclosed limits are less restrictive and areintended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

F. Fits And Clearances

Task 72-00-32-790-001:

1. Do A Vacuum Check Of The No. 1, 1.5, And 2 Bearing Compartments

A. Equipment And Materials Required

Standard Tools:
Rubber Plugs

Special Tools:
CTE 6075 Vacuum Cart
PWA 85474 Cover
PWA 85475 Plug (Optional to PWA 101110)
PWA 85481 Adapter (Optional to PWA 86315)
PWA 85497 Cover
PWA 85768 Puller
PWA 86315 Adapter
PWA 101110 Plug

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
R P06-054	Paste, Anti-Seize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	72-61-00 /8/160
Packing	1	72-62-00/6/30

B. Procedure

(1) Attach PWA 85481 Adapter to the rear of the angle gearbox with the detail washers and screws. See Figure 1301. If the gearbox driveshaft (front) housing assembly is attached to the angle gearbox, you must first disconnect it. See Figure 1302.

(a) Remove the lockwire and bolts that attach the brackets on the gearbox-driveshaft-(front)-housing (called front housing) to the HPC.

CAUTION: DO NOT USE A TOOL SUCH AS A SCREWDRIVER TO MOVE THE FRONT HOUSING AWAY FROM THE ANGLE GEARBOX. SUCH TOOLS CAN DAMAGE THE PARTS.

(b) Remove the bolts, nuts, and washers that attach the front housing and brackets to the angle gearbox.

(c) Carefully pull the front housing to the rear.

(d) Remove the retaining ring from the angle gearbox.

(e) Carefully pull the gearbox driveshaft to the rear.

(f) Discard the packing at the front of the front housing.

(2) If installation of the N1 bearing transducer is necessary but the transducer is not installed, install PWA 85474 Cover . See Figure 1301.

(a) Locate the three hole pad on the ID of the intermediate case at 4:30 o'clock.

(b) Attach the cover with bolts.

(c) Tighten the bolts by hand.

(3) If the N1 speed sensor is not installed, install PWA 101110 or PWA 85475 Plug. See Figure 1301.

(a) Locate the N1 speed sensor port at 4:30 o'clock.

(b) Lubricate two packings with White Petrolatum P06-002. Install the packings on the plug.

(c) Install the plug. The shoulder of the plug must touch the chamfer of the hole in the inner strut wall.

(4) Seal the oil pressure line.

(a) If the oil pressure tube is not connected to the intermediate case, install PWA 85497 Cover in the pressure tube pad of the intermediate case (at 9 o'clock). See Figure 1301.

(b) Attach the cover with detail screws.

(c) If the oil pressure tube is connected, break the oil pressure line where shown in the referenced figure. Install a standard rubber plug. See Figure 1303.

(5) Install a rubber plug.

(a) In the oil breather line at 11:30 o'clock. See Figure 1304.

(b) In the oil scavenge line at 7:30 o'clock. See Figure 1305.

(6) Attach the hoses of CTE 6075 Vacuum Cart to the fitting on the adapter.

(a) Set the vacuum cart pressure at PAMB minus 10 psi (69 kPa), or PAMB minus 20 inches (508 mm) HG. At sea level this is 5.0 psia (34.5 kPa absolute).

(b) (Pre SB PW4ENG 72-245) Airflow must not be greater than 32 lbs. (14.51 kg) per hour.

(c) (Post SB PW4ENG 72-245) Airflow must not be greater than 8 lbs. (3.63 kg) per hour.

(7) Disconnect the cart from the adapter. Remove the tools.

(8) Remove the rubber plug from the breather line at 11:30 o'clock. Connect the breather line. See Figure 1304.

R R (a) Apply Anti-Seize Paste P06-054 to the upper tube coupling threads. Remove the unwanted paste.

(b) Tighten and torque the tube nut to 1150 - 1300 lb-in. (129.933 - 146.880 N.m).

(c) Install lockwire.

(9) Remove the rubber plug from the scavenge line at 7:30 o'clock. Connect the scavenge line. See Figure 1305.

(a) Apply Engine Oil P03-001 to the coupling threads of the mating tubes.

(b) Tighten and torque the tube nut to 1300 - 1400 lb-in. (146.880 - 158.179 N.m).

(c) Install lockwire.

(10) If applicable, remove the rubber plug from the pressure line at 9:00 o'clock. Connect the pressure line. See Figure 1303.

R R (a) Apply Anti-Seize Paste P06-054 to the threads on the strainer housing. Remove the unwanted paste. Attach the tube nut of the main bearing oil pressure tube.

(b) Install and torque the clamp bolt that attaches the tube to the Flange E bracket to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(c) Tighten and torque the tube nut to 675 - 750 lb-in. (76.265 - 84.739 N.m).

(d) Install lockwire.

(11) Connect the gearbox driveshaft and the gearbox driveshaft front housing (called front housing) to the angle gearbox. See Figure 1302.

(a) Lubricate with Engine Oil P03-001 one packing. Install the packing on the front of the front housing.

(b) Move the retaining ring to the front of the driveshaft.

(c) Carefully push the driveshaft forward to mate with the internal splines in the angle gearbox.

(d) If the splines of the gearbox driveshaft and angle gearbox are not aligned, turn the gearshaft in the main gearbox. See Figure 1306.

1 Remove the two bolts and washers that attach the cover (manual crank) to the (scavenge pump drive) bearing housing assembly. Use PWA 85768Puller to remove the cover.

2 To align the splines of the gearbox driveshaft and the angle gearbox, turn the gearshaft in the main gearbox with a wrench.

3 Mate the gearbox driveshaft with the splines in the angle gearbox.

4 Lubricate the Engine Oil P03-001 a packing.

5 Install the packing on the cover (manual crank).

6 Install the cover in the main gearbox.

R R 7 Lubricate with Anti-Seize Paste P06-054 to the two bolts. Remove the unwanted paste.

8 Install two washers and the two bolts.

9 Torque the bolts to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(e) Install the retaining ring in the internal groove on the angle gearbox.

(f) Attach the front housing to the angle gearbox.

R R R 1 Lubricate with Anti-Seize Paste P06-054 to the threads of six nuts. Remove the unwanted paste.

2 Attach the front housing and brackets to the angle gearbox with two bolts, two washers, and two of the nuts.

3 Attach the front housing to the angle gearbox with four bolts, eight washers, and four nuts.

4 Torque the bolts to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(g) Attach the front housing brackets to the HPC.

1 Lubricate with Engine Oil P03-001 the threads of four bolts.

2 Attach the brackets to the HPC with the four bolts.

3 Torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

4 Install lockwire in the bolts.

ENGINE GENERAL - FAN CASE - REMOVAL-01

Task 72-00-33-020-001:

1. Remove Fan Case

NOTE: See Figure 301 for Part/Assembly Removal Procedure Sequence.

A. Prerequisites

(1) Remove low pressure compressor (LPC). See 72-00-31, Removal-01 (Task 72-00-31-020-003).

(2) Remove No. 3 bearing buffer air cooler. See Removal-05 (Task 72-00-33-050-002).

(3) For engines equipped with propulsion multiplexer unit (PMUX) remove multiplexer unit. See Removal-09 Task 72-00-33-050-004.

(4) Remove the fan exit fairing (bifurcation). See Removal-14 Task 72-00-33-050-009.

(5) Remove EEC fan case wiring harnesses W1 and W2. See
R Removal-06 (Task 72-00-33-050-003-A00).

(6) Remove fan case external plumbing. See Removal-02
R (Task 72-00-33-020-003-A00).

(7) Remove the compressor bleed actuator. See Removal-11 Task 72-00-33-050-006.

(8) If intermediate case is to be removed or replaced, remove air/oil heat exchanger and valve (engine). See 72-00-34 Removal-10 Task 72-00-34-050-007.

(9) If intermediate case is to be removed or replaced, remove air/oil heat exchanger and valve (IDGS). See 72-00-34, Removal-08 Task 72-00-34-050-005.

B. Equipment And Materials Required

Standard Tools:
1/4-28 Jackscrews (4 Necessary)
No. 10 Torq-set Drive

ENGINE GENERAL - FAN CASE - REMOVAL-01

Special Tools:

PWA 76154	Adapter (2 Necessary)
PWA 76155	Sling
PWA 85450	Stand, Storage/Transport (Optional to PWA 87078)
PWA 85678	Stand, Support (3 Necessary) (Optional to PWA 87166/PWA 101960)
PWA 85698	Adapter, Lift And Trunnion (2 Necessary) (Optional to PWA 86431)
PWA 85750	Block, Support (4 Necessary) (Optional to PWA 87166/PWA 101960)
PWA 85905	Fixture, Assemble Disassemble
PWA 86431	Adapter (2 Necessary)
PWA 87078	Stand, Storage/Transport
PWA 87166	Stand, Support (3 Necessary)
PWA 101224	Dolly, Support
PWA 101960	Adapter, Support (3 or 4 Necessary)

C. Procedure

(1) Install either PWA 86431 or PWA 85698 Adapters to fan case at 3 and 9 o'clock positions. Using hoist attach PWA 76155 Sling with PWA 76154 Adapters to adapters and place a slight tension on sling cables. As options, the following procedures for vertical support of the fan case may be used. See Figure 302.

(a) Use three PWA 85678 or PWA 87166 Stands with three PWA 101960 Adapters to support the fan case.

(b) Use four PWA 101224 Support Dollys with four PWA 101960 or PWA 85750 Adapters to support the fan case. The fan case assembly can be moved with this support system.

CAUTION: BE VERY CAREFUL WHEN YOU MOVE THE INNER (BIFURCATION) FAIRING. IT IS POSSIBLE THAT THERE ARE WASHERS ATTACHED TO THE FAIRING. IT IS EASY FOR THESE WASHERS TO BECOME DISCONNECTED FROM THE FAIRING.

(2) Be sure the fan exit fairing (bifurcation) at the 12 o'clock position strut is temporarily repositioned away from the fan case. See Removal-14 Task 72-00-33-050-009. See Figure 303.

CAUTION: BE VERY CAREFUL WHEN YOU REMOVE A LINER SEGMENT. IT IS POSSIBLE THAT THERE ARE WASHERS ATTACHED TO THE LINER. IT IS EASY FOR THESE WASHERS TO BECOME DISCONNECTED FROM THE LINER.

(3) Cut the sealant that is at the edges of the fan exit (front) liner segment assembly at 6 o'clock. Remove the liner. Use a No. 10 Torq−set drive. See Figure 304.

CAUTION: BE VERY CAREFUL WHEN YOU REMOVE A LINER SEGMENT. IT IS POSSIBLE THAT THERE ARE WASHERS ATTACHED TO THE LINER BRACKET. IT IS EASY FOR THESE WASHERS TO BECOME DISCONNECTED FROM THE BRACKET. ALSO, IF THE EDGE OF THE LINER SEGMENT HITS SOMETHING, IT CAN DELAMINATE.

(4) Remove all the screws/bolts that attach the fan exit (rear) liner segment assemblies. Remove the liners and spacers. Mark location of liners and spacers for assembly. See Figure 305.

NOTE: If the engine has acoustical fan exit liner segment assemblies, first remove the sealant that covers the screws, then remove the screws. To remove the sealant, use mechanical means. Be careful not to damage the engine parts.

(a) Mechanically remove the sealant that is at the trailing edges of the intermediate case struts.

(b) Remove the spacers.

NOTE: It is possible that the spacers are attached to the intermediate case with adhesive tape.

(c) Repair any loose or damaged intermediate case strut seals. Refer to Figure 306 and 72−00−34, Repair−03 Task 72−00−34−300−003.

(5) If it is there, cut and mechanically remove the optional sealant from the rear edge of the fan exit guide vane inner and outer bases.

(6) If air/oil heat exchangers and valves (IDGS and engine) are installed, remove 16 bolts and washers attaching valve inlet collars at 4 and 8 o'clock locations at 2.5 bleed support flange. See Figure 307.

(7) Remove the 4th stage compressor stator assembly (called stator assembly). See Figure 308.

  (a) Remove the 24 bolts and washers that attach the stator assembly to the intermediate case.

  (b) Assemble PWA 85905 Fixture.

    1 Put the jaw marked "Remove" on the screw.

    2 Put the jaw approximately 1.5 inch (38.100 mm) from the body.

    3 Have the same quantity of threads at both ends.

  (c) Engage the fixture in the tabs of the stator assembly and intermediate case at 11 o'clock.

  (d) While you hold the stator assembly, turn the screw to disengage the tabs of the two assemblies.

  (e) Remove the stator assembly. Discard the packings.

(8) Remove 36 bolts and washers securing 2.5 bleed support flange to intermediate case. See Figure 309.

(9) Disconnect W3P15 harness connector from 2.5 bleed valve actuator.

(10) Remove lockwire from compressor bleed actuator pressure and return tube coupling nuts. Disconnect tube coupling nuts from adapters on actuator and from tee fittings on connecting manifolds. Remove both tubes.

CAUTION: CASE ASSEMBLY SHOULD ONLY BE PLACED FRONT END DOWN (FLANGE A) TO PREVENT DAMAGE TO FAN EXIT GUIDE VANES.

(11) Remove the Flange C haredware as follows. Refer to 72-00-33, Removal-20 (Task 72-00-33-020-020).

(12) Using 1/4−28 Jackscrews at four equally spaced locations, approximately 3, 6, 9, and 12 o'clock, remove fan case from engine and install in either PWA 87078 or PWA 85450 Stand. Remove hoist, sling and adapters from fan case adapters.

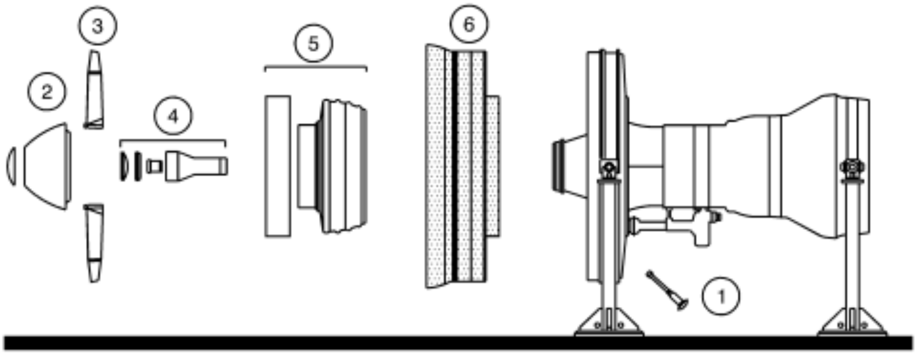
NOTE: Removal of fan case requires lowering and pulling radially inward from the actuator pad to allow fan case removal from intermediate case.

NOTE: Case assembly may be placed front end down (Flange A) on pallet, on three PWA 85678 Stands, on four PWA 85750 Blocks or on three PWA 87166 Stands with PWA 101960 Adapter.

(13) If air/oil heat exchangers and valves (IDGS and engine) are installed, remove four packings from four inlet sleeves (collars). Discard packings.

CAUTION: BE VERY CAREFUL WHEN YOU REMOVE THE INNER (BIFURCATION) FAIRING. IT IS POSSIBLE THAT THERE ARE WASHERS ATTACHED TO THE FAIRING. IT IS EASY FOR THESE WASHERS TO BECOME DISCONNECTED FROM THE FAIRING.

(14) Remove the loose (bifurcation) fairings from the strut at 12 o'clock position.



1. REMOVE ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).
2. REMOVE COMPRESSOR INLET CONE.
3. REMOVE STAGE 1 LPC BLADE ASSEMBLIES.
4. REMOVE LPC/LPT COUPLING.
5. REMOVE LOW PRESSURE COMPRESSOR (LPC).
6. REMOVE FAN CASE.

(Task 72-00-33-020-001)

ENGINE GENERAL - FAN CASE - REMOVAL-01

Task 72-00-33-020-006:

1. Remove Fan Case

NOTE: See Figure 301 for part/assembly removal procedure sequence.

A. Prerequisites

(1) Remove the low pressure compressor (LPC). See 72-00-31, Removal-01 Task 72-00-31-020-003.

(2) Remove the No. 3 bearing buffer air cooler. See 72-00-33, Removal-05 Task 72-00-33-050-002.

(3) For engines with the propulsion multiplexer unit (PMUX) remove the multiplexer unit. See 72-00-33, Removal-09 Task 72-00-33-050-004.

(4) Remove the fan exit fairing (bifurcation). See 72-00-33, Removal-14 Task 72-00-33-050-009.

(5) Remove the EEC fan case wiring harnesses W1 and W2.
R See 72-00-33, Removal-06 (Task 72-00-33-050-003-B00).

(6) Remove the fan case external plumbing. See 72-00-33, Removal-02 Task 72-00-33-020-003-A00.

(7) Remove the compressor bleed actuator. See 72-00-33, Removal-11 Task 72-00-33-050-006.

(8) If the intermediate case must be removed or replaced, remove air/oil heat exchanger and valve (engine). See 72-00-34, Removal-10 Task 72-00-34-050-007.

(9) If the intermediate case must be removed or replaced, remove the air/oil heat exchanger and valve (IDGS). See 72-00-34, Removal-08 Task 72-00-34-050-005.

B. Equipment And Materials Required

Standard Tools:
1/4-28 Jackscrews (4 Necessary)
No. 10 Torq-set Drive

ENGINE GENERAL - FAN CASE - REMOVAL-01

Special Tools:

PWA 76154	Adapter (2 Necessary)
PWA 76155	Sling
PWA 85450	Stand, Storage/Transport (Optional to PWA 87078)
PWA 85678	Stand, Support (3 Necessary) (Optional to PWA 87166/PWA 101960)
PWA 85698	Adapter, Lift And Trunnion (2 Necessary) (Optional to PWA 86431)
PWA 85750	Block, Support (4 Necessary) (Optional to PWA 87166/PWA 101960)
PWA 85905	Fixture, Assemble Disassemble
PWA 86431	Adapter (2 Necessary)
PWA 87078	Stand, Storage/Transport
PWA 87166	Stand, Support (3 Necessary)
PWA 101224	Dolly, Support
PWA 101960	Adapter, Support (3 or 4 Necessary)

C. Procedure

(1) Install either PWA 86431 Adapters or PWA 85698 Adapters to fan case at 3 and 9 o'clock positions. Using hoist, attach PWA 76155 Sling with PWA 76154 Adapters to adapters and place a slight tension on sling cables. As options, the following procedures for vertical support of the fan case may be used. See Figure 302.

(a) Use three PWA 85678 Stands or PWA 87166 Stands with three PWA 101960 Adapters to support the fan case.

(b) Use four PWA 101224 Support Dollys with four PWA 101960 Adapters or PWA 85750 Adapters to support the fan case. The fan case assembly can be moved with this support system.

CAUTION: BE VERY CAREFUL WHEN YOU MOVE THE INNER (BIFURCATION) FAIRING. IT IS POSSIBLE THAT THERE ARE WASHERS ATTACHED TO THE FAIRING. IT IS EASY FOR THESE WASHERS TO BECOME DISCONNECTED FROM THE FAIRING.

(2) Make sure the fan exit fairing (bifurcation) at the 12 o'clock position strut is temporarily moved away from the fan case. See 72-00-33, Removal-14 Task 72-00-33-050-009. See Figure 303.

CAUTION: BE VERY CAREFUL WHEN YOU REMOVE A LINER SEGMENT. IT IS POSSIBLE THAT THERE ARE WASHERS ATTACHED TO THE LINER. IT IS EASY FOR THESE WASHERS TO BECOME DISCONNECTED FROM THE LINER.

(3) Cut the sealant that is at the edges of the fan exit (front) liner segment assembly at the 6 o'clock. Remove the liner. Use a No. 10 Torq-set drive. See Figure 304.

CAUTION: BE VERY CAREFUL WHEN YOU REMOVE A LINER SEGMENT. IT IS POSSIBLE THAT THERE ARE WASHERS ATTACHED TO THE LINER BRACKET. IT IS EASY FOR THESE WASHERS TO BECOME DISCONNECTED FROM THE BRACKET. ALSO, IF THE EDGE OF THE LINER SEGMENT HITS SOMETHING, IT CAN DELAMINATE.

(4) Remove all the screws/bolts that attach the fan exit (rear) liner segment assemblies. Remove the liners and spacers. Mark the location of the liners and spacers for assembly. See Figure 305.

(a) Mechanically remove the sealant that is at the trailing edges of the intermediate case struts.

(b) Cut the sealant that is at the forward edge of the liners.

(c) Remove the spacers.

NOTE: It is possible that the spacers are attached to the intermediate case with adhesive tape.

(d) Repair any loose or damaged intermediate case strut seals. Refer to Figure 306 and 72-00-34, Repair-03 Task 72-00-34-300-003.

(e) Replace a fan exit liner seal if one of the items that follows applies. For replacement, refer to 72-00-33, Removal-17 Task 72-00-33-040-002 and Installation-17 Task 72-00-33-440-002. Refer to Figure 307.

1 The seal is loose or damaged

2 It is necessary to do an inspection of the fan exit inner case assembly.

(5) If it is there, cut and mechanically remove the optional sealant from the rear edge of the fan exit guide vane inner and outer bases.

(6) If the air/oil heat exchangers and valves (IDGS and engine) are installed, remove the 16 bolts and washers that attach the valve inlet collars at the 4 and 8 o'clock positions at the 2.5 bleed support flange. See Figure 308.

(7) Remove the 4th stage compressor stator assembly (called stator assembly). See Figure 309.

(a) Remove the 24 bolts and washers that attach the stator assembly to the intermediate case.

(b) Assemble PWA 85905 Fixture.

1 Put the jaw marked "Remove" on the screw.

2 Put the jaw approximately 1.5 inch (38.100 mm) from the body.

3 Have the same quantity of threads at both ends.

(c) Engage the fixture in the tabs of the stator assembly and intermediate case at 11 o'clock.

(d) While you hold the stator assembly, turn the screw to disengage the tabs of the two assemblies.

(e) Remove the stator assembly. Discard the packings.

(8) Remove 36 bolts and washers that attach the 2.5 bleed support flange to the intermediate case. See Figure 310.

(9) Disconnect the W3P15 harness connector from the 2.5 bleed valve actuator.

(10) Remove the lockwire from the compressor bleed actuator pressure and return tube coupling nuts. Disconnect the tube coupling nuts from the adapters on the actuator and from the tee fittings on the connecting manifolds. Remove both tubes.

CAUTION: CASE ASSEMBLY SHOULD ONLY BE PLACED FRONT END DOWN (FLANGE A) TO PREVENT DAMAGE TO FAN EXIT GUIDE VANES.

(11) Remove the Flange C hardware as follows. Refer to 72-00-33, Removal-20 (Task 72-00-33-020-020).

(12) Use 1/4-28 Jackscrews at four equally spaced locations, approximately 3, 6, 9, and 12 o'clock, remove the fan case from the engine and install into the PWA 87078 Stand or PWA 85450 Stand. Remove the hoist, sling and adapters from the fan case adapters.

NOTE: It is necessary for fan case removal to lower and pull radially inward from the actuator pad to permit fan case removal from the intermediate case.

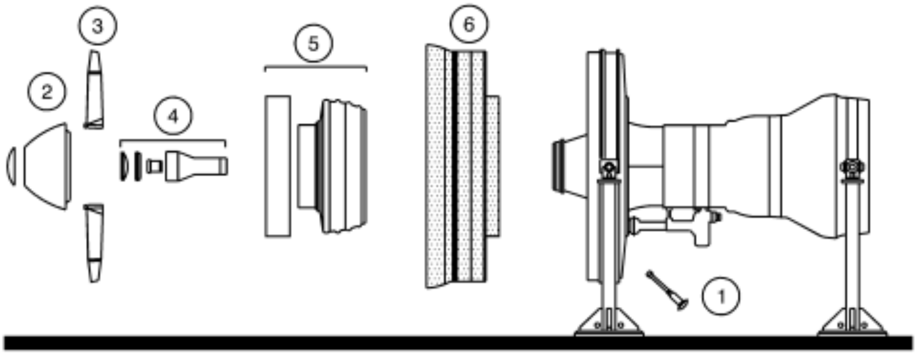
NOTE: The case assembly can be placed front end down (Flange A) on a pallet, on three PWA 85678 Stands, on four PWA 85750 Blocks or on three PWA 87166 Stands with PWA 101960 Adapters.

(13) If the air/oil heat exchangers and valves (IDGS and engine) are installed, remove the four packings from the four inlet sleeves (collars). Discard the packings.

CAUTION: BE VERY CAREFUL WHEN YOU REMOVE THE INNER (BIFURCATION) FAIRING. IT IS POSSIBLE THAT THERE ARE WASHERS ATTACHED TO THE FAIRING. IT IS EASY FOR THESE WASHERS TO BECOME DISCONNECTED FROM THE FAIRING.

(14) Remove the loose (bifurcation) fairings from the strut at the 12 o'clock position.

ENGINE GENERAL − FAN CASE − REMOVAL−01



1. REMOVE ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).
2. REMOVE COMPRESSOR INLET CONE.
3. REMOVE STAGE 1 LPC BLADE ASSEMBLIES.
4. REMOVE LPC/LPT COUPLING.
5. REMOVE LOW PRESSURE COMPRESSOR (LPC).
6. REMOVE FAN CASE.

ENGINE GENERAL - FAN CASE - REMOVAL-02

Task 72-00-33-020-003-A:

1. Remove Fan Case Plumbing For Engines With Basic Parts

A. Equipment And Materials Necessary - None

B. Procedure
See Figure 301.

R CAUTION: BE CAREFUL WHEN YOU HANDLE, REMOVE OR INSTALL ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTIONS USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE EXTERNAL WIRE BRAID AND IN THE INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(1) Remove PT2 (AS11) and PAM (AS10) flex hose assemblies as follows.

(a) Disconnect hose nuts from tube tees at approximately 9 o'clock position.

(b) Remove bolt, spacer, nut and clamps securing hoses to Flange B2 bracket at approximately 9 o'clock position.

(c) Remove hoses from engine and install protective closures.

(2) Remove PT4.95 (AS13) and PB (AS12) flex hose assemblies as follows.

(a) Disconnect hose nuts from tube tees at approximately 9 o'clock position.

(b) Remove bolt, spacer, nut and clamps securing hoses to Flange B bracket at approximately 9 o'clock position.

(c) Remove hoses from engine and install protective closures.

(3) Remove EEC PT4.95 (AS24) and EEC PB (AS23) manifold assemblies as follows.

(a) Remove bolts, spacer nuts and clamps securing manifolds to Flange B2 bracket and Flange B brackets.

(b) Remove manifolds from engine and install protective closures.

(4) Remove EEC PT2 (AS16) and EEC PAM (AS17) tube assemblies as follows.

(a) Remove lockwire and disconnect tube nuts from tube adapters at approximately 12 o'clock position rearward of Flange A1 and at approximately 11 o'clock position rearward of Flange B1.

(b) Remove jamnuts and adapters from Flange A1 bracket at approximately 12 o'clock position.

(c) Remove bolts, nuts and clamps securing tubes to Flange B brackets and Flange B1 bracket.

(d) Remove tubes from engine and install protective closures.

(5) Remove EEC PT4.95 (AS05) and EEC PB (AS19) tube assemblies as follows.

(a) Remove lockwire and disconnect tube nuts from tube coupling at approximately 12 o'clock rearward of Flange D and at approximately 11 o'clock position rearward of Flange B1.

(b) Remove bolts, nuts and clamps securing tubes to Flange B2 brackets, Flange C bracket and intermediate case.

(c) Remove tubes from engine and install protective closures.

(6) Remove EEC PT2 (AS22) and EEC PAM (AS21) manifold assemblies as follows.

(a) Remove bolts, spacer nuts and clamps securing manifolds to Flange B2 brackets.

(b) Remove manifolds from engine and install protective closures.

(7) For engines equipped with propulsion multiplexer unit (PMUX), remove PT2.5 sensing air tube assembly (AS28), data entry plug, and ground cable as follows. See Figure 302.

(a) Remove lockwire and disconnect hose and cap from tube at approximately 1 o'clock position.

(b) Remove lockwire and disconnect manifold nut from tube coupling just rear of Flange C at approximately 12 o'clock position.

(c) Remove bolts, nuts, and clamps securing tube to Flanges C and B2 brackets. Remove tube from engine.

(d) Install protective closures.

(e) Remove bolt and nut securing ground cable to Flange B2 bracket. Remove ground cable.

(f) Remove bolt and nut securing PMUX data entry plug lanyard to lower front PMUX mounting bracket on Flange B. Remove data entry plug.

Task 72−00−33−020−003−B:

2. Remove Fan Case Plumbing For Engines With Commonality Parts Between Airbus And McDonnell Douglas

A. Equipment And Materials Necessary − None

B. Procedure
See Figure 303.

R CAUTION: BE CAREFUL WHEN YOU HANDLE, REMOVE OR INSTALL
R ALL TUBES WHICH CONTAIN A FLEX DESIGN
R SEGMENT. REMOVE AND INSTALL A TUBE WITH A
R FLEX SEGMENT WITH THE SAME PRECAUTIONS
R USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO
R NOT BEND THE FLEXHOSE OF A TUBE TO HELP
R WITH THE INSTALLATION OR REMOVAL OF AN
R ATTACHED COMPONENT. IF A FLEX SEGMENT IS
R BENT TOO MUCH, THIS CAN CAUSE A KINK IN
R THE EXTERNAL WIRE BRAID AND IN THE INNER
R POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS
R OR TUBE RUPTURE CAN BE THE RESULT.

(1) Remove the PT2 (AS11), PAM (AS10), PT4.95 (AS13) and PB (AS12) flex hose assemblies.

   - (a) Disconnect the hose nuts from the manifold tees at a bracket between Flanges A1 and B1 at the 9 o'clock position.

   - (b) Remove the flex hoses from the engine and install protection covers.

- (2) Remove the lockwire from the three cap assemblies and the trap assembly. Remove the cap assemblies and trap assembly from the manifold tees and install protection covers.

- (3) Remove the EEC PB sensing manifold (AS23).

   - (a) Remove the lockwire and disconnect the tube nut from the manifold assembly at the 10:30 o'clock position.

   - (b) Remove the bolt and clamp that attaches the manifold to a bracket on Flange B1 at the 9 o'clock position.

   - (c) Remove the nuts and clamps that attach the manifold to three brackets (rearward of Flange B2) on the fan case.

   - (d) Remove the bolt that attaches the tee of the manifold to a bracket between Flanges A1 and B1 at the 9 o'clock position.

   - (e) Remove the clamp from the manifold at a bracket located between Flanges B2 and C at the 9:30 o'clock position. (Bolt and nut was previously removed with the fan case harnesses).

   - (f) Remove the manifold assembly from the engine and install protection covers.

- (4) Remove the EEC PAM manifold assembly (AS17).

   - (a) Remove the lockwire and disconnect the manifold nut from the bulkhead adapter on a bracket at Flange A1 at the 12 o'clock position.

   - (b) Remove the bolts and clamps that attach the manifold to seven brackets on Flange B.

(c) Remove the bolt that attaches the tee of the manifold to a bracket located between Flanges A1 and B1 at the 9 o'clock position.

(d) Remove the manifold from the engine and install protection covers.

(5) Remove the EEC PT4.95 sensing manifold assembly (AS24).

(a) Remove the lockwire and disconnect the tube nut from the manifold assembly at the 10:30 o'clock position.

(b) Remove the bolt and clamp that attaches the manifold to a bracket on Flange B1 at the 9 o'clock position.

(c) Remove the clamps that attach the manifold to three brackets (rearward of Flange B2) on the fan case.

(d) Remove the clamp from the manifold at a bracket located between Flanges B2 and C at the 9:30 o'clock position. (Bolt and nut was previously removed with the fan cases harnesses).

(e) Remove the bolt that attaches the tee of the manifold to a bracket between Flanges A1 and B1 at the 9 o'clock position.

(f) Remove the manifold assembly from the engine and install protection covers.

(6) Remove the EEC PT2 manifold assembly (AS16).

(a) Remove the lockwire and disconnect the manifold nut from the bulkhead adapter in a bracket on Flange A1 at the 12 o'clock position.

(b) Remove the clamps that attach the manifold to seven brackets on Flange B.

(c) Remove the bolt that attaches the tee of the manifold to a bracket located between Flanges A1 and B1 at the 9 o'clock position.

(d) Remove the manifold from the engine and install protection covers.

(e) Remove the lockwire from the jamnuts on the two adapters on a bracket located at the 12 o'clock position on Flange A1. Remove the adapters from the engine.

(f) For center engine configurations only, remove the lockwire and the EEC vent cap from the larger adapter at the 12 o'clock position on Flange A1.

(7) Remove the EEC PT4.95 sensing (AS05) and the EEC PB sensing (AS19) tube assemblies.

(a) Remove the lockwire and disconnect the tube nuts from tube couplings at the 12 o'clock position (rearward of Flange C).

(b) Remove the nuts and clamps that attach the tube assemblies to five brackets located rearward of Flange B2 on the fan case.

(c) Remove the bolts, nuts and clamps that attach the tube assemblies to brackets on Flange C at the 12 o'clock position.

(d) Remove the tubes from the engine and install protection covers.

(8) For engines not equipped with the supplemental control unit (SCU), remove the lockwire and the cap assembly (located at the 12:30 o'clock position) from the (AS29) tube. Install a protection cover to the end of tube.

(9) For engines equipped with the supplemental control unit (SCU) with multiplexing, remove the PT2.5 sensing hose (AS38), PT2.5 sensing manifold assembly (AS36), and PT2.5 sensing tube assembly (AS28). See Figure 304.

(a) Remove the (AS38) hose from the tee of the (AS36) manifold at the 3 o'clock position. Install protection covers on the hose assembly.

(b) Remove the lockwire and the cap assembly from the tee of the (AS36) manifold.

(c) Remove the lockwire and disconnect the tube nut to the coupling of the (AS36) manifold at the 2 o'clock position.

(d) Remove the bolts, nuts and clamps that attach the (AS36) manifold to brackets on Flanges B, B2 and C.

(e) Remove the bolt from the tee of the (AS36) manifold that attaches the manifold to a bracket on Flange B at the 3 o'clock position. Remove the manifold from the engine and install protection covers to the manifold openings.

(f) Remove the lockwire and disconnect the tube nut from the coupling of the (AS28) tube at the 12:30 o'clock position.

(g) Remove the bolts, nuts and clamps that attach the (AS28) tube to brackets on Flange C.

(h) Remove the (AS28) tube from the engine. Install protection covers to the tube assembly.

(10) For engines equipped with the supplemental control unit (SCU), remove the SCU programming plug and the SCU ground cable. See Figure 304.

(a) Remove the rivet pin and collar that attach the lanyard of the programming plug to the rearward side of the lower SCU mount bracket. Remove the SCU programming plug.

NOTE: The programming plug must stay with the engine when the SCU is removed or replaced.

(b) Remove the bolt, washer and nut that attach the SCU ground cable to a bracket on Flange B1. Remove the ground cable.

ENGINE GENERAL - FAN CASE - REMOVAL-03

Task 72-00-33-020-002-A:

1. Remove Front Fan Case For Basic Engines

A. Prerequisites

(1) Remove all Stage 1 LPC blade assemblies. See 72-00-31, Removal-04 Task 72-00-31-020-002-002.

(2) Remove electronic engine control. See Removal-04 Task 72-00-33-050-001.

(3) For engines equipped, remove propulsion multiplexer unit. See Removal-09 Task 72-00-33-050-004.

B. Equipment And Materials Required

Special Tools:

PWA 76154	Adapter (2 Necessary)
PWA 76155	Sling
PWA 85450	Stand, Storage/Transport (Optional to PWA 87078)
PWA 85676	Adapter, Lift And Trunnion (2 Necessary) (Optional to PWA 86423)
PWA 85677	Bracket, Handling
PWA 85678	Stand, Support (3 Necessary) (Optional to PWA 87166/PWA 101960)
PWA 85750	Block, Support (4 Necessary) (Optional to PWA 87166/PWA 101960)
PWA 86423	Adapter, Lift And Trunnion (2 Necessary)
PWA 87078	Stand, Storage/Transport
PWA 87166	Stand, Support (3 Necessary)
PWA 101224	Dolly, Support
PWA 101960	Adapter, Support (3 or 4 Necessary)

C. Procedure
See Figure 301.

(1) Remove bolt, nut and washers securing EEC data entry plug lanyard to Flange A1.

(2) Remove bolt and nut securing EEC ground strap to upper front mount bracket.

(3) Remove EEC PT4.95 (AS13) and EEC PB (AS12) flex hose assemblies as follows.

(a) Disconnect hose nuts from manifold tees at approximately 9 o'clock position.

(b) Remove bolt, spacer, nut and clamps securing hoses to Flange B bracket at approximately 9 o'clock position and remove hoses from engine.

(c) Install protective closures.

(4) Remove EEC PT4.95 (AS24) and EEC PB (AS23) manifold assemblies as follows.

(a) Remove lockwire and disconnect tube nuts from manifold couplings rearward of Flange B1 at approximately 11 o'clock position.

(b) Remove bolts, spacer, nuts and clamps securing manifolds to Flanges B and Flange B1 bracket between 9 and 10 o'clock positions.

(c) Remove manifolds from engine and install protective closures.

(5) Remove EEC PT2 (AS16) and EEC PAM (AS17) tube assemblies as follows.

(a) Remove lockwire and disconnect tube nuts from adapters at approximately 12 o'clock position on Flange A1 bracket. Remove lockwire and disconnect tube nuts from tube couplings rearward of Flange B1 at approximately 11 o'clock position.

(b) Remove bolts, nuts and clamps securing tubes to Flange B brackets between 12 and 11 o'clock positions.

(c) Remove bolt, nut and clamps securing tubes to Flange B1 bracket at approximately 11 o'clock position and remove tubes from engine.

(d) Install protective closures.

(6) Remove bolts, nut and clamp securing EEC wiring harness to Flange A1 bracket at approximately 9 o'clock position. Secure EEC wiring harness rearward of Flange B temporarily.

ENGINE GENERAL - FAN CASE - REMOVAL-03

CAUTION: AVOID TWISTING OR SEVERE BENDING OF WIRING HARNESS AT ANYTIME DURING REMOVAL OR DAMAGE TO HARNESS MAY RESULT.

(7) Remove bolt, nut and clamps securing EEC wiring harness to Flange A1 bracket at approximately 1 o'clock position. Secure EEC wiring harnesses rearward of Flange B temporarily.

(8) For engines equipped with propulsion multiplexer unit (PMUX), remove (PMUX) multiplexer data entry plug as follows:

(a) Remove bolt and nut securing plug lanyard to lower front PMUX support bracket on Flange B.

(b) Remove plug.

(9) Install either PWA 86423 or PWA 85676 Adapters at 3 and 9 o'clock of the front fan case. See Figure 304.

NOTE: If you do not store the front fan case, use PWA 85677 Bracket at 12 o'clock on the front flange as an alternative to the adapter and sling. Attach a hoist to the bracket.

(10) Remove the Flange B hardware as follows. Refer to 72-33-00, Disassembly-21 (Task 72-33-00-030-021).

(11) Using fiber mallet, gently tap front fan case to loosen flange.

(12) Remove front fan case from engine. Install PWA 76155 Sling on a hoist. Install two PWA 76154 Adapters on the sling. Install the adapters over the adapters on the front fan case. Install the fan case in either PWA 87078 Stand or PWA 85450 Stand. Remove the hoist, sling, and adapters.

NOTE: As alternatives to storage in the stand, the following two procedures for vertical support of the fan case may be used. See Figure 304.

NOTE: Use three PWA 85678 or PWA 87166 Stands with three PWA 101969 Adapters to support the fan case.

NOTE: Use four PWA 101224 Support Dollys with four PWA 101960 Adapters or PWA 85750 Adapters to support the fan case. The fan case assembly can be moved with this support system.

(13) If new case is to be installed comply with the following:

(a) Remove the Flange A1 hardware as follows. Refer to 72-33-00, Disassembly-20 (Task 72-33-00-030-020).

(14) If the ribs of the duct segment assemblies in the fan case are badly worn, or if the wear is not equal, do an inspection of the duct segment assemblies. See Figure 305. Refer to 72-33-01, Inspection/Check-04 (Task 72-33-01-200-004).

Task 72-00-33-020-002-B:

2. Remove Front Fan Case For Engines With The Airbus/McDonnell Douglas Common Parts Configuration

A. Prerequisites

(1) Remove all the Stage 1 LPC blade assemblies. See 72-00-31, Removal-04 (Task 72-00-31-020-002-002).

(2) Remove the electronic engine control (EEC). See 72-00-33, Removal-04 (Task 72-00-33-050-001).

(3) For engines equipped, remove the supplemental control unit (SCU). See 72-00-33, Removal-13 (Task 72-00-33-050-008).

B. Equipment And Materials Required

Special Tools:

PWA 76154	Adapter (2 Necessary)
PWA 76155	Sling
PWA 85450	Stand, Storage/Transport (Optional to PWA 87078)
PWA 85676	Adapter, Lift And Trunnion (2 Necessary) (Optional to PWA 86423)
PWA 85677	Bracket, Handling
PWA 85678	Stand, Support (3 Necessary) (Optional to PWA 87166/PWA 101960)
PWA 85750	Block, Support (4 Necessary) (Optional to PWA 87166/PWA 101960)
PWA 86423	Adapter, Lift And Trunnion (2 Necessary)

Special Tools:

(CONTINUED)

PWA 87078	Stand, Storage/Transport
PWA 87166	Stand, Support (3 Necessary)
PWA 101960	Adapter, Support (3 Necessary)

C. Procedure
See Figure 306.

NOTE: The ground cable and the programming plug can stay attached to the front upper mount bracket.

(1) Remove the PT2 (AS11), PAM (AS10), PT4.95 (AS13) and PB (AS12) flex hose assemblies.

(a) Disconnect the hose nuts from the manifold tees at a bracket between Flanges A1 and B1 at the 9 o'clock position.

(b) Remove the flex hoses from the engine and install protection covers.

(2) Remove the EEC PB sensing manifold (AS23).

(a) Remove the lockwire and disconnect the tube nut from the manifold assembly at the 10:30 o'clock position.

(b) Remove the bolt and clamp that attaches the manifold to a bracket on Flange B1 at the 9 o'clock position.

(c) Remove the bolt, clamp and nut that attach the W2 harness and the (AS23) manifold and the EEC PT4.95 manifold (AS24) to a bracket between (bridged) Flanges B2 and C at the 9:30 o'clock position.

(d) Remove the nuts and clamps that attach the manifold to three brackets (rearward of Flange B2) on the fan case.

(e) Remove the bolt that attaches the tee of the manifold to a bracket between Flanges A1 and B1 at the 9 o'clock position.

(f) Remove the manifold assembly from the engine and install protection covers.

Key to Figure 304

(3) Remove the EEC PAM manifold assembly (AS17).

(a) Remove the lockwire and disconnect the manifold nut from the bulkhead adapter on a bracket at Flange A1 at the 12 o'clock position.

(b) Remove the bolts and clamps that attach the manifold to seven brackets on Flange B.

(c) Remove the bolt that attaches the tee of the manifold to a bracket located between Flanges A1 and B1 at the 9 o'clock position.

(d) Remove the manifold from the engine and install protection covers.

(4) Remove the EEC PT4.95 sensing manifold assembly (AS24).

(a) Remove the lockwire and disconnect the tube nut from the manifold assembly at the 10:30 o'clock position.

(b) Remove the bolt and clamp that attaches the manifold to a bracket on Flange B1 at the 9 o'clock position.

(c) Remove the clamps that attach the manifold to three brackets (rearward of Flange B2) on the fan case.

(d) Remove the clamp from the manifold at a bracket located between Flanges B2 and C at the 9:30 o'clock position. (Bolt and nut was previously removed with the (AS23) manifold).

(e) Remove the bolt that attaches the tee of the manifold to a bracket between Flanges A1 and B1 at the 9 o'clock position.

FAN CASE
L-A7322 (0000)
PW V

Inspection Of The Ribs Of The Duct Segment Assemblies
Figure 305
(Task 72−00−33−020−002−A)

(f) Remove the manifold assembly from the engine and install protection covers.

(5) Remove the EEC PT2 manifold assembly (AS16).

(a) Remove the lockwire and disconnect the manifold nut from the bulkhead adapter in a bracket on Flange A1 at the 12 o'clock position.

(b) Remove the clamps that attach the manifold to seven brackets on Flange B.

(c) Remove the bolt that attaches the tee of the manifold to a bracket located between Flanges A1 and B1 at the 9 o'clock position.

(d) Remove the manifold from the engine and install protection covers.

(6) For engines equipped with the supplemental control unit (SCU) with multiplexing, remove the PT2.5 sensing manifold assembly (AS38), and PT2.5 sensing manifold assembly (AS36). See Figure 307.

NOTE: The programming plug can stay attached to the rear of the lower SCU mount bracket.

(a) Remove the (AS38) hose from the tee of the (AS36) manifold at the 3 o'clock position. Install protection covers on the hose assembly.

(b) Remove the lockwire and disconnect the tube nut to the coupling of the (AS36) manifold at the 2 o'clock position.

(c) Remove the bolts, nuts and clamps that attach the (AS36) manifold to brackets on Flanges B, B2 and C.

(d) Remove the bolt from the tee of the (AS36) manifold that attaches the manifold to a bracket on Flange B at the 3 o'clock position. Remove the manifold from the engine and install protection covers to the manifold openings.

CAUTION: DO NOT TWIST OR BADLY BEND THE WIRING HARNESS DURING REMOVAL. TWISTING OR BADLY BENDING THE WIRING HARNESS CAN DAMAGE THE WIRING HARNESS.

(7) For engines equipped with the supplemental control unit (SCU) do the following. See Figure 308.

(a) Remove the bolt, washer and nut that attach the SCU ground cable to a bracket on Flange B1. Remove the ground cable. See Figure 307, View F.

(8) Remove the eight bolts and clamps that attach the harness (W12 harness without SCU or W11 harness with SCU) to brackets on Flange A1 approximately at the 1:30 o'clock position. Temporarily attach the wiring harness rearward of Flange B.

(9) Remove the nut and clamp that attach the W2 harness to a bracket on Flange A1 at the 9:30 o'clock position. Temporarily attach the wiring harness rearward of Flange B.

(10) Install either PWA 86423 or PWA 85676 Adapters at the 3 and 9 o'clock positions on the front fan case. See Figure 309 and Figure 311.

NOTE: If you do not store the front fan case, use PWA 85677 Bracket at 12 o'clock on the front flange as an alternative to the adapters and sling. Attach a hoist to the bracket.

(11) Remove the Flange B hardware as follows. Refer to 72-33-00, Disassembly-21 (Task 72-33-00-030-021).

(12) Carefully tap the front fan case with a fiber mallet to loosen the flange.

(13) Remove the front fan case from the engine. Install PWA 76155 Sling on a hoist. Install two PWA 76154 Adapters on the sling. Install the adapters over the adapters on the front fan case. Install the fan case in either PWA 87078 or PWA 85450 Stand. Remove the hoist, sling and adapters.

NOTE: As an alternative to the storage stand, it is permitted to store the front fan case on four PWA 85750 Support Blocks, on three PWA 85678Stands, on three PWA 87166 Stands with PWA 101960 Adapters, or on a pallet.

(14) If a new case is to be installed comply with the following:

   (a) Remove the Flange A1 hardware as follows. Refer to 72−33−00, Disassembly−20 (Task 72−33−00−030−020).

(15) If the ribs of the duct segment assemblies in the fan case are badly worn, or if the wear is not equal, do an inspection of the duct segment assemblies. See Figure 311. Refer to 72−33−01, Inspection/Check−04 Task 72−33−01−200−004.

Task 72-00-33-050-001:

1. Remove Electronic Engine Control

A. Equipment And Materials Necessary - None

B. Procedure
See Figure 301.

R CAUTION: BE CAREFUL WHEN YOU HANDLE, REMOVE OR INSTALL
R ALL TUBES WHICH CONTAIN A FLEX DESIGN
R SEGMENT. REMOVE AND INSTALL A TUBE WITH A
R FLEX SEGMENT WITH THE SAME PRECAUTIONS
R USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO
R NOT BEND THE FLEXHOSE OF A TUBE TO HELP
R WITH THE INSTALLATION OR REMOVAL OF AN
R ATTACHED COMPONENT. IF A FLEX SEGMENT IS
R BENT TOO MUCH, THIS CAN CAUSE A KINK IN
R THE EXTERNAL WIRE BRAID AND IN THE INNER
R POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS
R OR TUBE RUPTURE CAN BE THE RESULT.

CAUTION: INSPECT THE ENGINE FAN CASE AT APPROXIMATELY THE ONE O'CLOCK POSITION FOR A FADEC CAUTION LABEL. THIS LABEL SHOWS THAT A UNIQUE MOUNTING EEC IS NECESSARY BECAUSE RING CASE HPC CONFIGURATION OR CUTBACK HPC STATORS ARE INSTALLED IN THE ENGINE. MAKE SURE THE CORRECT EEC IS INSTALLED.

(1) Disconnect EEC programming plug from electronic engine control upper left connector and leave plug attached to engine by its lanyard.

(2) Disconnect W1P6, W1P7 and W1P8 harness connectors from rear side of control (Channel A).

(3) Disconnect W2P2, W2P3 and W2P4 harness connectors from front side of control (Channel B).

(4) Disconnect four flex hoses from bottom of control.

(5) Remove bolt from upper front corner of control and disconnect ground strap.

(6) Remove bolts and washers from mounts at four corners and remove control from engine.

(7) Remove four adapters from control (where flex hoses were attached). Discard packings.

ENGINE GENERAL − FAN CASE − REMOVAL−04

(8) Install protective closures.

NOTE: For additional information concerning detailed maintenance of this component see Electronic Engine Control Component Maintenance Manual, 73−21−25 (Hamilton Standard Division).

ENGINE GENERAL - FAN CASE - REMOVAL-05

Task 72-00-33-050-002:

1. Remove The No. 3 Bearing Air Cooler Assembly
    - A. Equipment And Materials - None
    - B. Procedure
      See Figure 301.
        - (1) If there is sealant around the edges of the air cooler, cut the sealant.
        - (2) Remove lockwire and disconnect the two tube nuts attached to the No. 3 bearing air cooler assembly (called cooler).
        - (3) Remove the screws securing cooler to the intermediate case.
        - (4) Remove the bolts securing cooler to the mount bracket. Remove the cooler and classified spacer.

          NOTE: Keep the classified spacer with the cooler.

        - (5) Remove the midspan support as follows:
            - (a) Remove the bolt securing outer rod end bearing to the mount bracket. Remove the mount bracket.
            - (b) Remove lockwire from the nuts. Loosen the outer nut. Remove the outer rod end bearing from the strut. Remove the nut from the rod end bearing.
            - (c) Loosen the inner nut and remove the strut. Remove the nut from the inner rod end bearing.
            - (d) Remove the bolt and nut securing the inner rod end bearing to the bracket on the intermediate case. Remove the rod end bearing from the bracket.
        - (6) (Post SB PW4ENG 72-433) If necessary, remove the bolts and nuts that attach the supports along the axial edges of the cooler. Remove the supports.
        - (7) Install protective closures to the cooling air tubes.
        - (8) Mechanically remove any remaining sealant from the case and cooler.

ENGINE GENERAL - FAN CASE - REMOVAL-06

Task 72-00-33-050-003-A:

1. Remove EEC Fan Case Wiring Harnesses W1 And W2 For Basic Engines

NOTE: This procedure gives instructions for the complete removal of both the W1 and W2 harnesses. If only the fan case is to be removed, do not remove the harnesses rearward of Flange C.

A. Prerequisites
- (1) Remove the electronic engine control. See Removal-04 (Task 72-00-33-050-001).
- (2) If the fan exit fairing (bifurcation) does not have (access) covers for harness access, remove the fairing. See Removal-14 (Task 72-00-33-050-009).
- (3) Remove the fan exit liner segments (inner rear) that are at 11 and 1 o'clock. Refer to 72-00-33, Removal-16 (Task 72-00-33-040-001).

B. Equipment And Materials Required

Standard Tools:
No. 10 Torq-set Drive

Special Tools:
PWA 85749 Torque Adapter, Electronic Harness Connectors

C. Procedure
See Figures 301 through 310.

CAUTION: DO NOT TWIST OR BEND THE HARNESSES BADLY DURING REMOVAL OR DAMAGE TO HARNESSES CAN RESULT.

- (1) For engines with the fairing (access) covers (301/5), do as follows. Use a No. 10 Torq-set drive to remove the screws.
  - (a) Cut and remove the sealant from around the (rear) cover plate (301/1). Remove the screws (301/3) and cover plate (301/1).
  - (b) Cut and remove the sealant from around the two (access) covers (301/5). Remove the screws (301/4), (301/7), and (301/6) and the two (access) covers (301/5).
- (2) For engines incorporating propulsion multiplexer unit (PMUX), disconnect W2P20 harness connector from multiplexer unit. Install protective closure on harness and unit connectors.
- (3) Remove bolts, nuts and clamps securing W1 and W2 harnesses to brackets on Flanges A1, B1, B2 and C on fan case.

(4) If the intermediate case is to be removed, continue to remove the harnesses from the strut and the HPC as follows.

CAUTION: DO NOT DAMAGE THE HARNESSES WHEN YOU REMOVE THE SEALANT.

(5) Cut and remove the sealant around the grommets. Remove the sealant from around the harnesses.
(6) Remove the screws and the bolt that attach the harnesses to the intermediate case strut. Remove the clamp segment brackets, clamp segments, and grommets (upper and lower) that attach the harnesses. See Figure 308.
(7) Disconnect the W1P10 and W1P11 harness connectors from the solenoid valve located in the intermediate case at approximately 1 o'clock position. Use a PWA 85749 Torque Adapter if necessary. Install protective closures on the harness connectors and receptacles. See Figures 309 and 310.
(8) Disconnect the W1P24, W1P9, W1P25, and W2P26 harness connectors from the receptacles attached to the HPC case brackets. Install protective closures on the harness connectors and receptacles.
(9) Remove two bolts and the retaining bracket that attach the W2J9 harness receptacle to the HPC bracket. Install protective closures on the harness connector and receptacle.
(10) Remove the bolts, nuts, and clamps that attach the W1 and W2 harnesses to the brackets and tubes.
(11) Remove the harness ties as necessary. Remove the harnesses from the engine.

Task 72−00−33−050−003−B:

2. Remove EEC Fan Case Wiring Harnesses W1, W2, W11 (SCU Only) And W12 For Engines With Commonality Parts Between Airbus And McDonnell Douglas

NOTE: This procedure gives instructions for the complete removal of both the W1, W2, W11 (SCU only), and W12 harnesses. If only the fan case is to be removed, do not remove the harnesses rearward of Flange C.

A. Prerequisites
(1) Remove the electronic engine control. See Removal−04 (Task 72−00−33−050−001).
(2) Remove the fan exit liner segments (inner rear) that are at 11 and 1 o'clock. Refer to 72−00−33, Removal−16 (Task 72−00−33−040−001).

B. Equipment And Materials Required

Standard Tools:
No. 10 Torq−set Drive

Special Tools:
PWA 85749 Torque Adapter, Electronic Harness Connectors

C. Procedure
See Figures 311 through 323.

CAUTION: DO NOT TWIST OR BEND THE HARNESSES BADLY DURING REMOVAL OR DAMAGE TO HARNESSES CAN RESULT.

(1) Remove the fairing (access) covers as follows. Use a No. 10 Torq−set drive to remove the screws.
  (a) Cut and remove the sealant from around the rear cover plate (311/1). Remove the screws (301/3) and cover plate (311/1).
  (b) Cut and remove the sealant from around the two (access) covers (311/5). Remove the screws (311/4), (311/7), and (311/6) and the two (access) covers (311/5).

(2) For engines incorporating the supplemental control unit (SCU), disconnect W11P33 and W11P34 harness connectors from the supplemental control unit (SCU).
(3) Remove bolts, nuts and clamps securing W1, W2, W11 (SCU only) and W12 harnesses to brackets on Flanges A1, B1, B2 and C on fan case.
(4) If the intermediate case is to be removed, continue to remove the harnesses from the strut and the HPC as follows.

CAUTION: DO NOT DAMAGE THE HARNESSES WHEN YOU REMOVE THE SEALANT.

(5) Cut and remove the sealant around the grommets. Remove the sealant from around the harnesses.
(6) Remove the screws and the bolt that attach the harnesses to the intermediate case strut. Remove the clamp segment brackets, clamp segments, and grommets (upper and lower) that attach the harnesses. See Figure 319.

ENGINE GENERAL – FAN CASE – REMOVAL–06

(7) Disconnect the W1P10 and W1P11 harness connectors from the solenoid valve located in the intermediate case at approximately 1 o'clock position. Use a PWA 85749 Torque Adapter if necessary. Install protective closures on the harness connectors and receptacles. See Figure 320.

(8) Disconnect the W1P24, W1P9, W1P25, and W2P26 harness connectors from the receptacles attached to the HPC case brackets. Install protective closures on the harness connectors and receptacles.

(9) Remove two bolts and the retaining bracket that attach the W2J9 harness receptacle to the HPC bracket. Install protective closures on the harness connector and receptacle.

(10) Remove the bolts, nuts, and clamps that attach the W1, W2, W11 (with SCU) and W12 harnesses to the brackets and tubes.

(11) Remove the bolts that attach the harnesses clamp segments at the 10 o'clock position on the fan case. Remove the clamp segments. Remove the harnesses from the engine.

Previous Pageblock Return to Previous Menu Next Pageblock

ENGINE GENERAL − FAN CASE − REMOVAL−07

Task 72−00−33−020−005:

1. Remove Bleed Valve Assembly
   - A. Prerequisites
     - (1) Remove low pressure compressor (LPC). See 72−00−31, Removal−01 (Task 72−00−31−020−003).
   - B. Equipment And Materials Required − None
   - C. Procedure
     - (1) Remove cotter pin from 2.5 bleed actuator link to bell crank. Remove collar and pin from link. Discard cotter pin.
     - (2) Remove cotter pin from bell crank pivot pin and remove pin. Discard cotter pin.
     - (3) Remove 2.5 bleed valve with bell crank from front of engine.

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72−00−33−020−004:

1. Remove The Fan Exit Base And Vane Assemblies

A. Prerequisites

(1) Remove all Stage 1 LPC blade assemblies. See 72−00−31, Removal−04 (Task 72−00−31−020−002−002).

(2) Remove EEC wiring harnesses W1 and W2. See Removal−06
R (Task 72−00−33−050−003−A00).

(3) Remove the fan case external plumbing. See Removal−02
R (Task 72−00−33−020−003−B00).

B. Equipment And Materials

Special Tools:

PWA 76154	Adapter (2 Necessary)
PWA 76155	Sling
PWA 85698	Adapter, Lift And Trunnion (2 Necessary) (Optional to PWA 86431)
PWA 86431	Adapter (2 Necessary)

C. Procedure

(1) Install two PWA 86431 Adapters or PWA 85698 Lifting Adapters to the fan case at 3 and 9 o'clock positions. Lift PWA 76155 Sling with a hoist. Put two PWA 76154 Adapters on the sling. Put the spools of the lifting adapters in the other adapters. Put the fan case load on the hoist. See Figure 301.

(2) FOR THESE MODELS: 4152, 4156A, 4158
(Pre SB PW4ENG 72−262) Remove the lockwire and 168 bolts and washers that attach the base and vane assemblies to the fan exit (outer) case (called outer case). See Figure 302.

(3) FOR THESE MODELS: 4152, 4156A, 4158
(Post SB PW4ENG 72−262) Remove the nuts, brackets (if applicable), and washers that attach the base and vane assemblies to the outer case. Remove the slab−bolts that attach the bases to the outer case.

(4) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the nuts, brackets, and washers that attach the base and vane assemblies to the fan exit (outer) case (called outer case). Remove the slab−bolts that attach the bases to the outer case. See Figure 302.

(5) Remove the Flange C hardware as follows. Refer to 72-00-33, Removal-20 (Task 72-00-33-020-020).

CAUTION: DO NOT MOVE THE FRONT FAN CASE AND OUTER CASE TOO FAR FORWARD. IF YOU DO YOU CAN DAMAGE THE VANES.

(6) Carefully move the front fan case and outer case forward sufficiently to install a strap that will keep the vanes in position. Do not move the cases forward more than necessary.

(7) Put a strap around the OD of the vanes to keep them in the correct position.

(8) Remove the front fan case and outer case from the engine. Put them on a pallet front end down. Remove the sling and lifting adapters from fan case.

(9) See Installation-08 (Task 72-00-33-420-005) for vane replacement.

ENGINE GENERAL - FAN CASE - REMOVAL-09

Task 72-00-33-050-004:

1. Remove Propulsion Multiplexer Unit (PMUX)
    A. Equipment And Materials Required - None
    B. Procedure
        See Figure 301.
        (1) Remove bolt and nut securing ground cable to top of unit at approximately 1 o'clock position between Flange B and Flange B2.
        (2) Disconnect and remove PMUX programming plug from unit and leave attached to engine by its lanyard.

CAUTION: HOLD ADAPTER WITH WRENCH WHILE LOOSENING FLEX HOSE NUT, TO AVOID DAMAGE TO PROPULSION MULTIPLEXER UNIT PORT.

        (3) Disconnect flex hose from adapter on PMUX.
        (4) Disconnect W2P20 harness connector from PMUX and let lay on fan case.
        (5) Remove the four mounting bolts and washers from the PMUX. Remove the unit and four mounting spacers from the engine. Insall protective closures to the PMUX, harness connector, and hose connector.
        (6) If PMUX is to be replaced or repaired, remove adapter and discard packing. Install protective closures.

NOTE: For additional information concerning detailed maintenance of this component, see Propulsion Multiplexer Unit Component Maintenance Manual, 77-31-06 (Hamilton Standard Div.).

ENGINE GENERAL - FAN CASE - REMOVAL-10

Task 72-00-33-050-005:

1. Remove PMUX Programming Plug
   - A. Equipment And Materials Required - None
   - B. Procedure

     See Figure 301.
     - (1) Remove the bolt and nut that attach the PMUX programming plug lanyard to the Flange B bracket.
     - (2) Loosen and remove the plug from the multiplexer unit (PMUX). Install the protection covers.

       NOTE: For additional information concerning detailed maintenance of this component, see PMUX Programming Plug Component Maintenance Manual, 77-32-11, PN 50A638.

ENGINE GENERAL − FAN CASE − REMOVAL−11

Task 72−00−33−050−006:

1. Remove 2.5 Bleed Valve Actuator

A. Prerequisites

(1) Remove the fan exit liner segment (inner rear) that is at 7 o'clock. Refer to 72−00−33, Removal−16 (Task 72−00−33−040−001).

B. Equipment And Materials Required − None

C. Procedure

See Figure 301.

(1) Remove the lockwire and disconnect the hydraulic pressure tube (CP06) and the hydraulic return tube (CR02) from the actuator and from the manifold tees. Collect the residual fuel. Remove the tubes. If equipped (Post SB PW4ENG 75−45), remove the bolt, nut, and clamps. Install the protection covers.

NOTE: Approximately 1/2 pint (1/4 liter) of fuel will drain from actuator.

(2) Disconnect W3P15 harness connector from actuator.

(3) For engines with the 2.5 bleed actuator support bracket do the following.

(a) (Post SB PW4ENG 75−84 and Pre SB PW4ENG 75−126) Remove the three bolts and nuts that attach the support bracket to a bracket on Flange E.

(b) (Post SB PW4ENG 75−126) Remove the three bolts from the nutplates on the the support bracket that attaches it to a bracket on Flange E.

(c) Remove the lockwire and the two bolts that attach the support bracket to the 2.5 bleed actuator. Remove the bracket from the actuator.

ENGINE GENERAL − FAN CASE − REMOVAL−11

CAUTION: TO AVOID SHOULDER BOLTS DAMAGE, BE AWARE THAT SHOULDER BOLT IS LEFT HAND THREAD AND HOLD ACTUATOR PISTON SHAFT HEX WHILE LOOSENING SHOULDER BOLT.

(4) Remove cotter pin securing shoulder bolt to bleed valve rod end clevis and remove shoulder bolt (left hand thread).

(5) Remove four bolts and washers securing actuator to intermediate case.

CAUTION: ENSURE CRIMPED LOCKING CUP AND RETAINING NUT DO NOT TURN WHEN PISTON SHAFT HEX IS ROTATED AS SUCH ROTATION WILL AFFECT ACTUATOR INTERNAL ADJUSTMENT.

(6) Remove actuator by rotating piston shaft hex counterclockwise to disengage internal threads securing piston shaft to rod end clevis.

(7) If new actuator is to be installed, remove adapters and from ports and discard packings.

(8) Install protective closures.

NOTE: For additional information concerning detailed maintenance of the component, see Intercompressor (2.5) Bleed Actuator Component Maintenance Manual, 75−31−34 (Hamilton Standard).

ENGINE GENERAL - FAN CASE - REMOVAL-12

Task 72-00-33-050-007-A:

1. Remove The EEC Programming Plug For Basic Engines
   - A. Equipment And Materials Required - None
   - B. Procedure

     See Figure 301.
     - (1) Remove the bolt, nut and washers that attach the lanyard to the inlet case Flange A1.
     - (2) Loosen and remove the EEC programming plug from the EEC.
     - (3) Install protection covers to the EEC connector and the programming plug.

       NOTE: For additional information concerning the detailed maintenance of this component, see the EEC Data Entry Plug Component Maintenance Manual, 73-21-56 (PW Manual PN 50A450).

Task 72-00-33-050-007-B:

2. Remove The EEC Programming Plug For Engines With Commonality Parts Between Airbus And McDonnell Douglas
   - A. Equipment And Materials Required - None
   - B. Procedure

     See Figure 301.
     - (1) Remove the rivet pin and collar that attach the lanyard to the upper forward mount bracket of the electronic engine control (EEC).
     - (2) Loosen and remove the EEC programming plug from the EEC.
     - (3) Install protection covers to the EEC connector and the programming plug.

       NOTE: See the EEC Programming Plug Component Maintenance Manual, 73-21-56 (PW Manual PN 50A450) for additional information and detailed maintenance of this component.

ENGINE GENERAL - FAN CASE - REMOVAL-13

Task 72-00-33-050-008:

1. Remove The Supplemental Control Unit

   A. Equipment And Materials Required - None

   B. Procedure

   See Figure 301.

   (1) Disconnect the connector assembly (SCU programming plug) (301/7) from the lower rear side connector of the supplemental control unit. Keep the connector assembly attached to the engine by its lanyard.

   (2) Disconnect the W11P34 connector (301/1) and the W11P33 connector (301/2) from the rear side of the supplemental control unit.

   (3) Remove the bolt (301/9) from the top rear side of the supplemental control unit and disconnect the ground cable.

   (4) If the supplemental control unit has the multiplexing option, remove the top connector of the hose assembly (301/3) from the bottom side of the supplemental control unit.

   (5) Remove the bolts and washers (301/8) from the mounts at the four corners and remove the supplemental control unit from the engine.

   (6) If the supplemental control unit does not have the multiplexing option and the unit is to be replaced, remove the cap assembly (301/10) from the bottom side of the supplemental control unit.

   (7) If the supplemental control unit is to be replaced, remove the adapter (301/5) from the bottom side of the supplemental control unit. Discard the packing (301/4).

   (8) If the supplemental control unit does not have the auto-start option and the unit is to be replaced, remove the two protective caps (301/6) from the rear side of the supplemental control unit.

(9) Install protection covers to the openings and electrical connectors on the supplemental control unit and the wiring harness.

NOTE: For more maintenance data of this component, see the Supplemental Control Unit Component Maintenance Manual, 73−21−24 (Bendix Engine Controls Division).

ENGINE GENERAL - FAN CASE - REMOVAL-14

Task 72-00-33-050-009:

1. Remove The Fan Exit (Bifurcation) Fairing Assemblies (Pre SB PW4ENG 72-370)

A. Equipment And Materials Required

Standard Tools:
No. 3 Cross-Drive (Phillips)
No. 10 Torq-set Drive

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIGURE	ITEM
Lockwire, AS3214-02				

B. Procedure

See Figure 301.

NOTE: Use a No. 3 Cross-Drive (Phillips) with the shoulder screws. Use a No. 10 Torq-set drive with all the other screws.

(1) Disassemble the fan exit (bifurcation) fairing assemblies as follows.

(a) For engines with the cover plate (301/12) installed, cut and remove the sealant from around the cover plate. Remove the screws (301/13) and cover plate.

(b) (Post SB PW4ENG 72-161) Cut and remove the sealant from around the access covers (301/6). Remove the screws (301/7) and (301/8) and the two access covers.

(c) Cut and remove the sealant from around the bottom of the inner (bifurcation) fairing (301/2) and the top of the outer (bifurcation) fairing (301/1). Remove the screws (301/3), (301/4) (301/9), (301/10), and (301/11).

CAUTION: BE VERY CAREFUL WHEN YOU MOVE THE INNER (BIFURCATION) FAIRING. IT IS POSSIBLE THAT THERE ARE WASHERS ATTACHED TO THE FAIRING. IT IS EASY FOR THESE WASHERS TO BECOME DISCONNECTED FROM THE FAIRING.

(d) Temporarily attach the fairings away from the harness grommets and the fan cases with lockwire.

(2) If the complete removal of the fairings is necessary, remove the fan case. See Removal−01 (Task 72−00−33−020−001).

Task 72−00−33−050−009−A:

2. Remove The Fan Exit (Bifurcation) Fairing Assemblies (Post SB PW4ENG 72−370)

A. Equipment And Materials

Standard Tools:
No. 3 Cross−Drive (Phillips)
No. 10 Torq−set Drive
T−10 Torx Tip

B. Procedure

See Figure 302.

NOTE: Unless otherwise specified, use a No. 3 Cross−Drive (Phillips) with the shoulder screws. Use a No. 10 Torq−set drive with all the other screws.

(1) Cut and remove the sealant from around the cover plate (302/10). Remove the screws (302/11) and the cover plate.

(2) Cut and remove the sealant from around the access covers (302/8). Remove the screws (302/9), (302/9A), and (302/7) and the access covers.

(3) Cut and remove the sealant from around the top of the outer fairing (302/1). Remove the screws (302/12) and (302/13), and (302/14) and the outer fairing.

Task 72−00−33−050−010:

1. Remove The Supplemental Control Unit (SCU) Programming Plug

A. Equipment And Materials Required − None

B. Procedure

See Figure 301.

NOTE: Inside the programming plug, the engine serial number is identified (by electronics) to a specified engine (by serial number). Programming plugs are not interchangeable with each other unless a new plug is made to the same engine serial number.

(1) Remove the collar and pin that attach the lanyard to the SCU lower (rearward) mount bracket.

(2) Loosen and remove the programming plug from the SCU.

(3) Install protection covers to the SCU connector and to the programming plug.

ENGINE GENERAL - FAN CASE - REMOVAL-16

Task 72-00-33-040-001:

1. Remove The Fan Exit Liner Segment Assemblies (Procedure To Use With The Removal Of A Component)

A. Equipment And Materials

Standard Tools:
No. 10 Torq-set Drive

B. Procedure

See Figure 301.

CAUTION: BE VERY CAREFUL WHEN YOU REMOVE A LINER SEGMENT. IT IS POSSIBLE THAT THERE ARE WASHERS ATTACHED TO THE FRONT LINER BRACKET. IT IS EASY FOR THESE WASHERS TO BECOME DISCONNECTED FROM THE BRACKET. ALSO, IF THE EDGE OF THE LINER SEGMENT HITS SOMETHING, IT CAN DELAMINATE.

(1) If the liner is at 11 or 1 o'clock, cut the sealant that is at the axial edge of the liner.

(2) Remove all the screws/bolts that attach the liners. Remove the liners.

(3) If you remove more than one liner, make marks on the case to show the locations of the liners.

NOTE: If the engine has acoustical fan exit liner segment assemblies, first remove the sealant that covers the screws, then remove the screws. To remove the sealant, use mechanical means. Be careful not to damage the engine parts.

(4) If the spacer plates (called spacers) are not bonded to the case, remove the spacers. Keep each spacer with its liner.

(5) If the spacers are bonded to the case, do not remove the spacers.

ENGINE GENERAL - FAN CASE - REMOVAL-20

Task 72-00-33-020-020:

1. Remove The Flange C Brackets And Hardware

   A. Equipment And Materials Necessary - None

   B. Procedure

      (1) Remove the Flange C brackets as follows. See Figure 301.

         (a) Tag and identify the flange C hardware for the correct bolthole locations.

            NOTE: All the part item numbers in the figures are the same as the item numbers in the IPC.

         (b) Remove 108 nuts, washers, bolts, and brackets securing cases at Flange C.

Task 72-00-33-420-001:

1. Install Fan Case

NOTE: See Figure 401 for part/assembly installation procedure sequence.

A. Prerequisites

(1) See Inspection/Check-01 Task 72-00-33-990-001 for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Required

Standard Tools:
Glenair TG-69 Soft Jawed Pliers or
Glenair TG-70 Strap Wrench
0.020 Inch (0.508 mm) Shim Stock
1 Inch (25.400 mm) Depth Micrometer
No. 10 Torq-set Drive
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 76154	Adapter (2 Necessary)
PWA 76155	Sling
PWA 85698	Adapter, Lift And Trunnion (2 Necessary) (Optional to PWA 86431)
PWA 85905	Fixture, Assemble Disassemble
PWA 86431	Adapter, Lift And Trunnion (2 Necessary)

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-038	Cheesecloth, Unsized
P05-099	Tape, Moisture Resistant (PMC 4141)
P05-133	Mold Release (PWA 36007-1)
P05-137	Bonding Preventative, Teflon S (PWA 36038)
P05-231	Tape, Adhesive Transfer (PWA 36745)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P06-053	Lubricant, Sealing Ring (PWA 36500)

Consumable Materials:

Item No.	Designation
(CONTINUED)	
P06-054	Paste, Antiseize (PWA 36246)
P09-014	Sealant, Silicone Rubber (PWA 36003)
P09-027	Sealant, Silicone Rubber (PWA 36003-2)
P09-029	Sealant, Silicone Rubber
P11-014	Alcohol, Isopropyl (PMC 9094)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	2	24-11-00/1/6
Packing	1	72-34-00/12/40
Packing	1	72-34-00/12/140
Packing	2	79-21-00/3/4

C. Procedure To Install Parts Other Than the Fan Exit Liner Segment Assemblies

(1) If not installed on the intermediate case, loosely attach the gasket, and inner and outer (bifurcation) fairings to the front of the intermediate case at the 12 o'clock strut. See Figure 402.

NOTE: Installation of fairing to be completed after installation of W1 and W2 wiring harnesses through fairings.

(2) If the air/oil heat exchangers and valves (engine and IDGS) were left installed, lubricate the four new packings with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 and install to the four inlet sleeves (collars) on the two heat exchangers at approximately 4 o'clock and 8 o'clock positions on the intermediate case. See Figure 403.

(3) If not installed, install either PWA 86431 or PWA 85698 Adapter to the flanges of the fan case at 3 and 9 o'clock. Using hoist and PWA 76155 Sling with PWA 76154 Adapters, raise fan case from stand and install

on engine, aligning dowel and dowel pin hole. See Figure 404.

NOTE: Installation of fan case requires raising and pulling radially inward to outward from actuator pad to allow fan case assembly to engage intermediate case.

(4) Install eight equally spaced washers and bolts, threads lubricated with Engine Oil P03-001, to secure 2.5 bleed valve support flange. Install 27 bolts, threads lubricated with Engine Oil P03-001, equally spaced around Flange C with heads forward. Secure with washers and nuts. See Figure 405.

(5) Using opposite bolt pattern draw cases together alternating between Flange C and 2.5 bleed valve support bolts. Torque 2.5 bleed valve support bolts to 290 - 325 lb-in. (32.776 - 36.720 N.m). Torque Flange C nuts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(6) Install remaining 28 bleed valve support bolts, threads lubricated with Engine Oil P03-001, and washers for total of 36 bolts. Torque bolts to 290 - 325 lb-in. (32.776 - 36.720 N.m).

(7) Install Flange C hardware as follows. Refer to 72-00-33, Installation-20 (Task 72-00-33-420-020).

(8) Remove hoist, sling, and adapters from fan case adapters. Remove adapters from fan case.

(9) If air/oil heat exchangers and valves (engine and IDGS) are installed, secure inlet sleeves (collars) to 2.5 bleed support with 16 bolts, threads lubricated with Engine Oil P03-001, and washers. Torque bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m). See Figure 403.

NOTE: Install outer bolts from intermediate case side and inner bolts from (front) fan case side.

(10) Install the 4th stage compressor stator assembly (called stator assembly). See Figure 406.

(a) Apply Sealing Ring Lubricant P06-053 or Engine Oil P03-001 to the stator assembly packings.

(b) Put the packings in the grooves on the front and rear OD of the stator assembly.

(c) Assemble PWA 85905 Fixture.

1 Put the jaw marked "install" on the tool 1.5 inch (38.100 mm) from the body.

2 Make the quantity of threads the same at both ends of the screw.

(d) Put the stator assembly against the intermediate case. The dowel pin in the rear of the stator assembly will engage the offset hole at 12 o'clock. Rotate the stator assembly to partially engage the tabs of the intermediate case.

(e) At 11 o'clock, engage the fixture in the tabs of the stator assembly and the intermediate case. Turn the screw of the fixture to fully engage the tabs of the stator assembly and intermediate case.

(f) Apply Engine Oil P03-001 to the threads of 24 bolts.

(g) Attach the stator assembly to the intermediate case with washers and the 24 bolts. Torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(h) Remove the fixture.

(11) If not installed, install compressor bleed actuator pressure and return tubes. See Figure 407.

(a) Remove protective closures.

(b) Lubricate return tube (CR02) nut threads with Engine Oil P03-001 and connect to manifold tee and to forward adapter on the actuator.

(c) Lubricate pressure tube (CP06) nut threads with Antiseize Paste P06-054 and connect tube to manifold tee and to rear adapter on the actuator. Wipe off unwanted paste.

(d) For (Post SB PW4ENG 75-45) engines, install clamps, bolt, lubricated with Engine Oil P03-001, and nut that attach the tube together. Torque the clamp bolt to 30 - 40 lb-in. (4.067 - 4.519 N.m).

(e) Torque return tube (CR02) nuts to 270 - 300 lb-in. (30.506 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(f) Torque pressure tube (CP06) nut at manifold tee to 340 - 375 lb-in. (38.415 - 42.369 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(g) Torque pressure tube (CP06) nut at actuator to 225 - 250 lb-in. (25.422 - 28.246 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(12) Connect the W3P15 harness connector to the compressor bleed actuator as follows.

(a) Remove protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight all the bent pins. If necessary, clean the connector and receptacle by SPOP 6 (Task 70-21-00-110-900). Refer to Section 70-21-00 in the Standard Practices Manual, PN 585005.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG-70 strap wrench or the Glenair TG-69 soft-jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal). This procedure

will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

D. Procedure To Install The Fan Exit Liner Segment Assemblies See Figure 408.

CAUTION: ACOUSTICAL AND NONACOUSTICAL LINERS ARE IN SETS. BUT THE LINER THAT IS AT 6 O'CLOCK IS A NONACOUSTICAL LINER.

(1) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
If not installed, install the fan exit liner seals. Refer to Installation-17 (Task 72-00-33-440-002).

(2) (Reference 1005) Find the washer thickness necessary to make a 0.005 - 0.020 inch (0.127 - 0.508 mm) thick empty space between the washers and fan exit (rear) liner segment assemblies (called liners), as follows. See Figure 409.

(a) Attach 0.020 inch (0.508 mm) shim stock to the OD of the bracket at the rear of the case and vane assembly. Use Tape P05-099.

CAUTION: BE VERY CAREFUL WHEN YOU REMOVE OR INSTALL A LINER SEGMENT. IF THE EDGE OF THE LINER SEGMENT HITS SOMETHING, IT CAN DELAMINATE.

(b) Temporarily attach the liner to the case with screws or bolts.

(c) With a depth micrometer in the two forward holes, measure the depth from the top surface of the liner to the surface of the shim stock (Dimension A).

(d) Remove the liner and shim stock.

(e) Measure the thickness of the liner (Dimension B).

(f) Subtract Dimension B from Dimension A to know the necessary thickness of the washers.

(g) Use Table 401 to choose the correct washer classification. Zero to three washers are necessary.

Class	Washer Thickness - Inch (mm)
1	0.009 - 0.011 (0.229 - 0.279)
2	0.019 - 0.021 (0.483 - 0.503)
3	0.029 - 0.031 (0.737 - 0.787)
4	0.039 - 0.041 (0.991 - 1.041)
5	0.049 - 0.051 (1.244 - 1.295)
6	0.099 - 0.101 (2.514 - 2.565)

Fan Exit (Rear) Liners - Washer Thickness
Table 401

(3) Attach the washers to the brackets, as follows.

(a) Use SPOP 208 Wipe Method (Task 70-21-00-110-040) to clean the areas you will bond.

(b) Dry the areas fully in air that is at room temperature. When dry, there must be no solvent on the parts.

(c) Apply Sealant P09-014 to the edges of the washers. Do not apply sealant to the mating surfaces of the washer and bracket. Use screws/bolts to temporarily hold the washers in position.

(4) Find the correct classification of spacer plate (called spacer). The surface of the liner must be flush within 0.020 inches (0.508 mm) of the platform of the strut. See Table 402. See Figure 410 or 411. Install the spacer as follows.

NOTE: Refer to the key of Figure 411 or 412 for the necessary tolerance in Area AH.

NOTE: Only a Class 4 spacer is permitted with an acoustical liner.

Class	Spacer Thickness - Inch (mm)
1	0.022 - 0.028 (0.559 - 0.711)
2	0.036 - 0.044 (0.914 - 1.118)
3	0.058 - 0.068 (1.473 - 1.727)
4	0.075 - 0.085 (1.905 - 2.159)
5	0.095 - 0.105 (2.413 - 2.667)
6	0.120 - 0.130 (3.048 - 3.302)

Spacer Plate Thickness
Table 402

(a) Prepare the spacer and V-groove rail for the installation of tape as follows.

1 With a piece of clean Cheesecloth P05-038 that is moist with Alcohol P11-014, wipe the areas you will bond.

2 Dry the surfaces fully in air that is at room temperature. When dry, there must be no alcohol on the parts.

(b) Install Tape P05-231 on either the V-groove rail or the spacer. Remove tape from the bolt holes.

(c) Align the holes of the V-groove rail and the spacer. Install the spacer on the V-groove rail.

(5) Apply sealant to the space on the V-groove rail between the ends of the spacers as follows.

(a) Mechanically remove any sealant that is in the applicable area of the V-groove rail.

(b) Prepare the V-groove rail as follows.

1 Clean the area where you will apply the sealant. Use a piece of clean Cheesecloth P05-038 that is moist with Alcohol P11-014.

2 Dry the surface fully in air that is at room temperature. When dry, there must be no alcohol on the parts.

(c) Apply Sealant P09-027 to the area of the V-groove rail that you cleaned.

(d) Apply Mold Release P05-133 to the mating area of the liner.

(6) Install the liners as follows.

(a) Remove the temporary screws/bolts that attach the washers to the brackets.

CAUTION: BE VERY CAREFUL WHEN YOU REMOVE OR INSTALL A LINER SEGMENT. THE WASHERS THAT ARE ATTACHED TO THE FRONT LINER BRACKET CAN BECOME DISCONNECTED FROM THE BRACKET. ALSO, IF THE EDGE OF THE LINER SEGMENT HITS SOMETHING, IT CAN DELAMINATE.

(b) Attach the liners to the cases with screws/bolts, threads lubricated with Engine Oil P03-001. Tighten the screws/bolts with your hand. Engines with non-acoustical liners, refer to Figure 411. Engines with acoustical liners, refer to Figure 411.

NOTE: Screws are (Pre SB PW4ENG 72-107). Bolts are (Post SB PW4ENG 72-107).

NOTE: The liner that is at 6 o'clock does not use screws/bolts at the leading edge.

(c) Torque all the screws/bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m) in the order that follows:

1 Front fasteners.

2 Rear fasteners.

3 Fasteners adjacent to the intermediate case struts.

(d) Visually examine each fastener to make sure that it is correctly installed and touches the washer. If the fastener does not touch the washer, remove it, apply new lubricant and install it again.

NOTE: It is not necessary for the fastener to be symmetrically installed in the washer recess.

(e) Permit the sealant at the trailing edge to cure in air that is at room temperature and has a relative humidity of 25 percent, for two hours, minimum, and until no longer tacky. Remove unwanted sealant from the flowpath.

(7) For engines with the acoustical fan exit liner segment assemblies (inner rear), use one of the methods that follow to fill the screw holes in the liners. See Figure 411.

NOTE: The liner at 6 o'clock is a non-acoustical liner.

(a) First method:

1 Clean the screw heads and holes with Alcohol P11-014.

2 Cover the screw heads only with Sealant P09-029.

3 Fill the outer part of the holes and an area approximately 0.125 inch (3.175 mm) larger than the hole with Sealant P09-014.

(b) Second method:

1 Cover the screw heads with Tape P05-231, film side up.

2 Clean the holes with Alcohol P11-014.

3 Fill the outer part of the holes and an area approximately 0.125 inch (3.175 mm) larger than the hole with Sealant P09-014.

(c) Third method:

1 Cover the screw heads with Bonding Preventative P05-137. Cure at 400°F (204.4°C) for one hour.

2 Clean the holes with Alcohol P11-014.

3 Fill the outer part of the holes and an area approximately 0.125 inch (3.175 mm) larger than the hole with Sealant P09-014.

(d) Fourth method:

1 Fill the screw holes with AMS 7267 or AMS 7276 packing material.

2 Clean the packing material and holes with Alcohol P11-014.

3 Fill the outer part of the holes and an area approximately 0.125 inch (3.175 mm) larger than the hole with Sealant P09-014.

(8) Apply sealant at the trailing edges of the intermediate case struts, as follows. See Figure 412.

(a) Clean the areas that the sealant will touch. Use a clean piece of Cheesecloth P05-038 that is moist with Alcohol P11-014.

(b) Dry the surfaces fully in air that is at room temperature. There must be no alcohol on the parts when sealant is applied.

(c) Apply Sealant P09-027 at the trailing edges of the struts.

(d) Cure the sealant in air that is at room temperature and has a relative humidity of 25 percent, minimum, for eight hours before engine operation.

(9) Install the fan exit (front) liner segment assembly at 6 o'clock as follows. See Figure 413.

CAUTION: BE VERY CAREFUL WHEN YOU INSTALL A LINER SEGMENT. IT IS POSSIBLE THAT WASHERS ARE ATTACHED TO THE LINER. IT IS EASY FOR THE WASHERS TO BECOME DISCONNECTED FROM THE LINER.

(a) Attach the liner to the fan case with 20 screws, threads lubricated with Engine Oil P03-001. Torque the screws to 36 - 40 lb-in. (4.067 - 4.519 N.m). Refer to Table 403 for screw lengths.

Screw PN	Screw Length Inches (mm)	Washer Thickness Inches (mm)	Quantity of Screws
593111	0.495 - 0.505 (12.57 - 12.83)	0.000 - 0.015 (0.00 - 0.38)	0 - 20 As Necessary

Fan Exit (Front) Liners - Washer Thickness And Screw Length
Table 403

Screw PN	Screw Length Inches (mm)	Washer Thickness Inches (mm)	Quantity of Screws
ST1382-09	0.542 - 0.562 (13.77 - 14.27)	0.016 - 0.070 (0.41 - 1.78)	0 - 20 As Necessary
ST1382-10	0.594 - 0.625 (15.09 - 15.88)	0.071 - 0.130 (1.80 - 3.30)	0 - 20 As Necessary
ST1382-11	0.656 - 0.687 (16.66 - 17.45)	0.131 - 0.210 (3.33 - 5.33)	0 - 20 As Necessary

Fan Exit (Front) Liners - Washer Thickness And Screw Length
Table 403 (Continued)

(b) Do a check of the clearance between the trailing edges of all the fan exit (front) liner segment assemblies and the fan exit (rear) liner segment assemblies. See Inspection/Check-05 (Task 72-00-33-210-004).

(c) Clean the mating axial edges of the front liner at 6 o'clock. Also clean the rear cutouts of all the front liners. Use a clean piece of Cheesecloth P05-038 that is moist with Alcohol P11-014.

(d) Dry the surfaces fully in air that is at room temperature. There must be no alcohol on the parts when sealant is applied.

(e) Apply Sealant P09-027 to the mating axial edges of the (front) liner. Also apply Sealant P09-027 to the rear cutouts of all the front liners. Cure the sealant in air that is at room temperature, and has a relative humidity of 25 percent, minimum, for eight hours before engine operation.

(f) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Apply sealant to the empty spaces between the front liner and the rear liner at the 6 o'clock panel location as follows. See Figure 413 (Sheet 2).

1 FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Clean the surfaces that are in touch with the sealant by SPOP 208 (Task 70-21-00-110-040). Refer to Section 70-21-00 in the Standard Practices Manual, PN 585005.

2 FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Dry the surfaces fully in air that is at room temperature. When dry, there must be no sign of solvent on the parts.

3 FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Apply sealant P09-027 to the empty space between the front liner and the rear liner at the 6 o'clock panel location. The surface of the sealant must be smooth and continuous.

4 FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Cure the sealant for eight hours, minimum, before you touch the parts.

(10) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Apply sealant to the leading edges of the intermediate case struts, as follows. See Figure 414.

(a) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Clean the areas that the sealant will touch. Refer to PWA 83-D2 (Task 70-48-00-360-001).

(b) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Apply sealant P09-027 at the leading edges of the struts. The surface of the sealant must be smooth and continuous.

(c) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Cure the sealant for eight hours, minimum, before you touch the parts.

(11) Optional, apply sealant to the space between the inner fan exit guide vane bases and the fan exit inner liner segments; and the outer fan exit guide vane bases and the intermediate case as follows: See Figure 415.

NOTE: The optional sealant can be applied to help reduce erosion of the vane base material.

(a) Remove any loose sealant.

(b) Clean the areas that the sealant will touch. Refer to PWA 83-D4 (Task 70-48-00-360-001) in section 70-48, Standard Practices Manual, PN 585005.

NOTE: The fan exit guide vane base material is polyetherimide.

R
R

(c) Apply Sealant P09−029 at the rear of the inner and outer fan exit guide vane bases as shown in the referenced figure. The surface of the sealant must be smooth and continuous and flush to 0.040 inch (1.016 mm) below the adjacent surface.

(d) Remove excess sealant.

(e) Cure the sealant in air with a relative humidity of 50 percent minimum at 75° F (23.9° C) or equivalent. Cure the sealant for 24 hours, minimum, before you touch the parts.

NOTE: The sealant is fully cured in 72 hours.

E. Postrequisites

(1) If intermediate case was removed or replaced, install air/oil heat exchanger and valve (engine). See 72−00−34, Installation−10 (Task 72−00−34−450−006).

(2) If intermediate case was removed or replaced, install air/oil heat exchanger and valve (IDGS). See 72−00−34, Installation−08 (Task 72−00−34−450−004).

(3) Install No. 3 bearing buffer air cooler. See Installation−05 (Task 72−00−33−450−002).

(4) Install low pressure compressor (LPC). See 72−00−31, Installation−01 (Task 72−00−31−420−003).

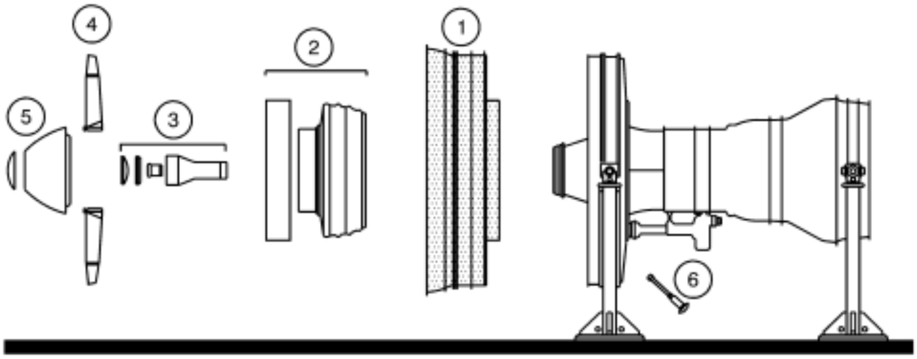
(5) Install fan case external plumbing. See
R Installation−02 (Task 72−00−33−420−003−A00).

(6) Install EEC fan case wiring harnesses W1 and W2. See
R Installation−06 (Task 72−00−33−450−003−A00).

(7) Install the fan exit fairing (bifurcation). See Installation−14 (Task 72−00−33−450−009).

(8) For engines equipped with propulsion multiplexer unit, install multiplexer unit. See Installation−09 (Task 72−00−33−450−004).

(9) Test engine per Test Reference Table. See 71−00−00, Testing−00 (Task 71−00−00−990−003).



1. INSTALL FAN CASE.
2. INSTALL LOW PRESSURE COMPRESSOR (LPC).
3. INSTALL LPC/LPT COUPLING.
4. INSTALL STAGE 1 LPC BLADE ASSEMBLIES.
5. INSTALL COMPRESSOR INLET CONE.
6. INSTALL ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).

1. Make Sure There Is Sealant Between The Flange Of The Strut And The V−Groove Rail. If The Sealant Is Not There, Apply New Sealant. Refer To 72−34−00, Assembly−01 (Task 72−34−00−400−001).

   NOTE: This sealant, Index 1, must be cured before you apply sealant, Index 2.
2. Apply Sealant In Area CK For Distance CL.

   NOTE: Do not apply sealant in the area between the second and third struts at Locations E. This area will be sealed when the No. 3 bearing air cooler assembly is installed in Installation−05 (Task 72−00−33−450−002).
3. Bond The Spacers.
4. Apply Mold Release To The Rear Edge Of The Liner In Area CM From The Edge Of The Liner To The First Bolthole. This Is The Area That Will Contact The Sealant For Distance CL.

Task 72-00-33-420-003-A:

1. Install Fan Case Plumbing For Basic Engines

A. Equipment And Materials Necessary

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 Or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)

B. Procedure
See Figure 401.

CAUTION: DO NOT USE LUBRICANTS ON EEC OR PMUX SENSING TUBES, ADAPTERS, OR PACKINGS. CONTAMINATION OF EEC OR PMUX CAN RESULT.

R CAUTION: BE CAREFUL WHEN YOU HANDLE, REMOVE OR INSTALL
R ALL TUBES WHICH CONTAIN A FLEX DESIGN
R SEGMENT. REMOVE AND INSTALL A TUBE WITH A
R FLEX SEGMENT WITH THE SAME PRECAUTIONS
R USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO
R NOT BEND THE FLEXHOSE OF A TUBE TO HELP
R WITH THE INSTALLATION OR REMOVAL OF AN
R ATTACHED COMPONENT. IF A FLEX SEGMENT IS
R BENT TOO MUCH, THIS CAN CAUSE A KINK IN
R THE EXTERNAL WIRE BRAID AND IN THE INNER
R POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS
R OR TUBE RUPTURE CAN BE THE RESULT.

(1) Install EEC PT2 (AS22) and EEC PAM (AS21) manifold assemblies as follows.

(a) Install manifolds with clamps, spacer, bolts, threads lubricated with Engine Oil P03-001, and nuts to Flange B2 brackets at four locations.

(b) Torque clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(2) Install EEC PT2 (AS16) and EEC PAM (AS17) tube assemblies as follows.

(a) Install smaller adapter to rear right hole of Flange A1 bracket at approximately 12 o'clock position. Install jamnut to front of adapter and torque nut to 58 − 62 lb−in. (6.553 − 7.005 N.m).

(b) Install larger adapter to rear left hole of Flange A1 bracket at approximately 12 o'clock position. Install jamnut to front of adapter and torque nut to 70 − 80 lb−in. (7.903 − 9.039 N.m).

(c) Remove protective closures and install tubes to adapters at approximately 12 o'clock position and to manifold couplings rearward of Flange B1 at approximately 11 o'clock position handtight only.

(d) Secure tubes with clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts to Flange B brackets and Flange B1 bracket. Torque clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(e) Torque PT2 tube (smaller nuts) to 135 − 150 lb−in. (15.253 − 16.948 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the nuts. Torque PAM tube (larger nuts) to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the nuts.

(3) Install EEC PT4.95 (AS24) and EEC PB (AS23) manifold assemblies as follows.

(a) Remove protective closures and install manifolds with clamps, spacer, bolts, threads lubricated with Engine Oil P03−001, and nuts to Flange B brackets (three locations) and to Flange B1 bracket.

(b) Torque clamp bolts to 36 − 40 lb−in.(4.067 − 4.519 N.m).

(4) Install EEC PT4.95 (AS05) and EEC PB (AS19) tube assemblies as follows.

ENGINE GENERAL − FAN CASE − INSTALLATION−02

(a) Remove protective closures and install tubes to tube couplings at approximately 12 o'clock position rearward of Flange D and at approximately 11 o'clock rearward of Flange B1 handtight only.

(b) Secure tubes with clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts to Flange B2 brackets (two locations), Flange C bracket, and intermediate case. Torque clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) For engines not equipped with propulsion multiplexer unit (PMUX), torque tube nuts to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the nuts.

(d) For engines equipped with propulsion multiplexer unit (PMUX) torque PT4.95 tube nuts to 270 − 300 lb−in. (30.506 − 33.895 N.m) and PB tube nuts to 135 − 150 lb−in. (15.253 − 169.948 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the nuts. (Engines with PMUX incorporate smaller diameter PB tube and manifold).

(5) Install PT4.95 (AS13) and PB flex (AS12) hose assemblies as follows.

(a) Remove protective closures and install PT4.95 and PB flex hoses to forward two manifold tees, at approximately 9 o'clock position, handtight only.

(b) Secure hoses with clamps, bolt, threads lubricated with Engine Oil P03−001, spacer, and nut to Flange B bracket at approximately 9 o'clock position. Torque clamp bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) Torque smaller nut (PB hose) to 200 − 225 lb−in. (22.597 − 25.422 N.m).

(d) Torque larger nut (PT4.95 hose) to 450 − 500 lb−in. (50.843 − 56.492 N.m).

1 (Post SPN No. P3042 and Post SB PW4ENG 72−645) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the hose nut(s) as applicable.

(6) Install PT2 (AS11) and PAM (AS10) flex hose assemblies as follows.

(a) Remove protective closures and install PT2 and PAM flex hoses to rearward two manifold tees, at approximately 9 o'clock position, handtight only.

(b) Secure hoses with clamps, bolt, threads lubricated with Engine Oil P03-001, spacer, and nut to Flange B2 bracket at approximately 9 o'clock position. Torque clamp bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(c) Torque smaller nut (PT2 hose) to 90 - 100 lb-in. (10.169 - 11.298 N.m).

1 (Post SPN No. P3042) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the hose nut(s) as applicable.

(d) Torque larger nut (PAM hose) to 135 - 150 lb-in. (15.253 - 16.948 N.m).

1 (Post SPN No. P3042) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the hose nut(s) as applicable.

(7) For engines equipped with propulsion multiplexer unit (PMUX), install PT2.5 sensing air tube assembly (AS28) as follows. See Figure 402.

(a) Remove protective closures.

(b) Install tube to Flange C bracket with clamp, bolt, threads lubricated with Engine Oil P03-001, handtight only.

NOTE: Flange C clamp bolt to be torqued with wire harness installation. See Installation-06.

(c) Install clamps, bolts, threads lubricated with Engine Oil P03-001, and nuts securing tube to Flange B2 brackets. Torque clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(d) Torque manifold nut to tube coupling, at approximately 12 o'clock position, to 135 − 150 lb−in. (15.253 − 16.948 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the nut.

(e) Install (PT2.5) hose and cap to tee end of tube handtight only.

(f) Torque cap to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the cap.

(g) Position hose and torque hose nut to tube tee to 270 − 300 lb−in. (30.506 − 33.895 N.m).

(h) Secure (PMUX) multiplexer data entry plug lanyard to front of Flange B bracket with bolt, threads lubricated with Engine Oil P03−001, and nut. Position lanyard away from case and torque bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(i) Secure ground cable to Flange B2 bracket with bolt, threads lubricated with Engine Oil P03−001, and nut. Torque bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

Task 72−00−33−420−003−B:

2. Install Fan Case Plumbing For Engines With The Airbus/McDonnell Douglas Common Parts Configuration

A. Equipment And Materials Necessary

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 Or M307

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)
P05−289	Lockwire (AS3214−02)
P05−291	Cable, Safety (Optional)
P05−292	Ferrule, Safety Cable (Optional)

B. Procedure
See Figure 403.

CAUTION: DO NOT USE LUBRICANTS ON THE EEC AND THE SCU SENSING MANIFOLD, TUBE AND HOSE ASSEMBLIES. CONTAMINATION OF THE EEC OR SCU UNITS CAN RESULT.

R CAUTION: BE CAREFUL WHEN YOU HANDLE, REMOVE OR INSTALL
R ALL TUBES WHICH CONTAIN A FLEX DESIGN
R SEGMENT. REMOVE AND INSTALL A TUBE WITH A
R FLEX SEGMENT WITH THE SAME PRECAUTIONS
R USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO
R NOT BEND THE FLEXHOSE OF A TUBE TO HELP
R WITH THE INSTALLATION OR REMOVAL OF AN
R ATTACHED COMPONENT. IF A FLEX SEGMENT IS
R BENT TOO MUCH, THIS CAN CAUSE A KINK IN
R THE EXTERNAL WIRE BRAID AND IN THE INNER
R POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS
R OR TUBE RUPTURE CAN BE THE RESULT.

(1) Install the EEC PT2 manifold assembly (AS16).

(a) Install a larger adapter into the rear right hole in a bracket on Flange A1 at the 12 o'clock position. Install a jamnut onto the front of the adapter and torque the nut to 70 − 80 lb−in. (7.903 − 9.039 N.m).

(b) Install a smaller adapter into the rear left hole in a bracket on Flange A1 of the 12 o'clock position. Install a jamnut onto the front of the adapter and torque the nut to 58 − 62 lb−in. (6.553 − 7.005 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the jamnuts.

(c) Remove the protection covers and install the tee end of the manifold to a bracket between Flanges A1 and B1 located at the 9 o'clock position. Install the opposite end of the manifold to the smaller adapter at the 12 o'clock position and tighten the manifold nut by hand.

(d) Attach the manifold (tee) to the bracket at the 9 o'clock position with a bolt, threads lubricated with Engine Oil P03−001 and tighten by hand.

(e) Install seven clamps to the manifold assembly at seven bracket locations on Flange B.

(2) Install the EEC PT4.95 sensing manifold assembly (AS24).

NOTE: If necessary loosen the bracket (bridged between Flanges B2 and C) to install the tube clamps and tubes (AS23) and (AS24).

(a) Remove the protection covers and install the tee end of the manifold to a bracket between Flanges A1 and B1 located at the 9 o'clock position. Install the coupling end of the manifold rearward of Flange B2 at the 10:30 o'clock position.

(b) Attach the manifold (tee) to the bracket at the 9 o'clock position with a bolt, threads lubricated with Engine Oil P03−001 and tighten by hand.

(c) Attach the manifold to a bracket on Flange B1 at the 9 o'clock position with a clamp and a bolt, threads lubricated with Engine Oil P03−001. Tighten the bolt by hand.

(d) Install a clamp to the manifold at a bracket location (bridged) between Flanges B2 and C at the 9:30 o'clock position. (Bolt is installed with the fan case harnesses).

(e) Install three clamps to the manifold assembly of three bracket locations between Flanges B2 and C.

(3) Install the EEC PAM manifold assembly (AS17).

(a) Remove the protection covers and install the tee end of the manifold to a bracket between Flanges A1 and B1 located at the 9 o'clock position. Install the opposite end of the manifold to the larger adapter at the 12 o'clock position and tighten the manifold nut by hand.

(b) Attach the manifold (tee) to the bracket at the 9 o'clock position with a bolt, threads lubricated with Engine Oil P03−001 and tighten by hand.

(c) Install seven clamps to the manifold assembly at seven bracket locations on Flange B.

(d) Attach the seven clamps on the EEC PT2 manifold (AS16) and the seven clamps on the EEC PAM manifold (AS17) to the brackets on Flange B with bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(e) Torque the bolt that attaches the manifold tee to the bracket at the 9 o'clock position to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(f) Torque the manifold nut to the adapter at the 12 o'clock position to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the manifold nut.

(g) For center engine configurations only, install the EEC vent cap to the front of the larger adapter at the 12 o'clock position. Torque the cap to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the cap.

(4) Torque the EEC PT2 manifold assembly (AS16).

(a) Torque the bolt that attaches the manifold tee to the bracket at the 9 o'clock position to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(b) Torque the manifold nut to the adapter at the 12 o'clock position to 135 − 150 lb−in. (15.253 − 16.948 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the manifold nut.

(5) Install the EEC PB manifold assembly (AS23).

(a) Remove the protection covers and install the tee end of the manifold to a bracket between Flanges A1 and B1 located at the 9 o'clock position. Install the coupling end of the manifold rearward of Flange B2 at the 10:30 o'clock position.

(b) Attach the manifold (tee) to the bracket at the 9 o'clock position with a bolt, threads lubricated with Engine Oil P03−001 and tighten by hand.

(c) Attach the manifold to a bracket on Flange B1 at the 9 o'clock position with a clamp and a bolt, threads lubricated with Engine Oil P03−001. Tighten the bolt by hand.

(d) Install a clamp to the manifold at a bracket location (bridged) between Flanges B2 and C at the 9:30 o'clock position. (Bolt is installed with the fan case harnesses).

NOTE: If the bracket (bridged between Flanges B2 and C) has been loosened for installation of the tube clamps and tubes (AS23) and (AS24) do as follows. Torque again the nuts that attach the bracket to the flanges to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(e) Install three clamps to the manifold assembly at three bracket locations between Flanges B2 and C.

(f) Attach the three clamps on the PT4.95 sensing manifold (AS24) and the three clamps on the EEC PB manifold (AS23) to the three brackets located between Flanges B2 and C with bolts, threads lubricated with Engine Oil P03−001 and tighten by hand.

(6) Install the PB sensing tube assembly (AS19).

(a) Remove the protection covers and install the tube to the coupling end of the EEC PB manifold (AS23) located rearward of Flange B2 at the 10:30 o'clock position. Install the opposite end of the tube to the coupling end of a tube (AS20) located at the 12 o'clock (strut) position. Tighten the tube nuts by hand.

(b) Install five clamps onto the tube assembly at five brackets located between Flanges B2 and C.

(c) Install two clamps onto the tube assembly at two brackets located on Flange C. Attach the clamps to the brackets with nuts and bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(7) Install the PT4.95 sensing tube assembly (AS05).

(a) Remove the protection covers and install the tube to the coupling end of the PT4.95 sensing manifold (AS24) located rearward of Flange B2 at the 10:30 o'clock position. Install the opposite end of the tube to the coupling end of a tube (AS04) located at the 12 o'clock (strut) position. Tighten the tube nuts by hand.

(b) Install five clamps onto the tube assembly at five brackets located between Flanges B2 and C.

(c) Attach the five clamps on PT4.95 sensing tube (AS05) and the five clamps on the PB sensing tube (AS19) to the five brackets located between Flanges B2 and C with nuts, threads lubricated with Engine Oil P03−001. Torque the five nuts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(d) Attach the tube to a bracket on Flange C located at the 12 o'clock position with a clamp, nut and bolt, threads lubricated with Engine Oil P03−001. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(8) Torque the bolts that attach the tee of the EEC PB manifold (AS23) and the tee of the PT4.95 sensing manifold (AS24) to the bracket (bridged) between Flanges A1 and B1 at the 9 o'clock position to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(9) Torque the nuts that attach the clamps on the PB sensing manifold (AS23) and the clamps on the PT4.95 sensing manifold (AS24) to the three brackets located between Flanges B2 and C to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(10) Torque the two bolts that attach the clamp on the PB sensing manifold (AS23) and the clamp on the PT4.95 sensing manifold (AS24) to the bracket on Flange B1 at the 9 o'clock position to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(11) Torque the tube nuts on the PT4.95 sensing tube (AS05) at the 12 o'clock (strut) position and at the 10:30 o'clock position located between Flanges B2 and C to 150 − 175 lb−in. (16.948 − 19.772 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the tube nuts.

(12) Torque the tube nuts on the PB sensing tube (AS19) at the 12 o'clock (strut) position and at the 10:30 o'clock position located between Flanges B2 and C to 90 - 100 lb-in. (10.169 - 11.298 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the tube nuts.

(13) Install the PB flex hose assembly (AS12) and a trap assembly to the EEC PB manifold assembly (AS23).

(a) Remove the protection covers and install the flex hose to the tee of the manifold (AS23) located on a bracket (bridged) between Flanges A1 and B1 at the 9 o'clock position.

(b) Torque the flex hose nut to 270 - 300 lb-in. (30.506 - 33.895 N.m). (Post SB PW4ENG 72-645) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the hose nut(s) as applicable.

(c) Install a trap assembly to the tee of the manifold. Torque the trap assembly to 320 - 350 lb-in. (36.155 - 39.545 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the trap assembly.

(d) (For engines equipped with the supplemental control unit (SCU) only). Install a trap assembly (Post SB PW4ENG 73-137) to the tee of the manifold. Torque the trap assembly to 320 - 350 lb-in. (36.155 - 39.545 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the trap assembly.

(e) (Post SB PW4ENG 73-137) (For engines equipped with the supplemental control unit (SCU) only). Installation of the insulation blankets.

1 Cut the blanket open. Trim the length of the blanket sufficiently to be installed between each tube clamp and tube connector.

2 Install the insulation blanket around the EEC PB sensing tube (AS19) and the EEC PB manifold (AS23) between each clamp.

3 Install the lacing tape between 0.75 − 1.00 inch (19.050 − 25.400 mm) along the blanket. See Figure 403 (Sheet 8).

NOTE: Longitudinal bulges and open distances between the tie points on the insulation blanket is permitted. Longitudinal overlap between the insulation blankets is not permitted.

NOTE: The insulation blanket may contact the fan case, other tubes, and brackets.

(14) Install the PT4.95 flex hose assembly (AS13) and a cap assembly to the PT4.95 sensing manifold (AS24).

(a) Remove the protection covers and install the flex hose to the tee of the manifold (AS24) located on a bracket (bridged) between Flanges A1 and B1 at the 9 o'clock position.

(b) Torque the flex hose nut to 450 − 500 lb−in. (50.843 − 56.492 N.m).

1 (Post SPN No. P3042) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the hose nut(s) as applicable.

(c) Install a cap assembly to the tee of the manifold and torque to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the cap assembly.

(15) Install the PAM flex hose assembly (AS10) and a cap assembly to the EEC PAM manifold (AS17).

(a) Remove the protection covers and install the flex hose to the tee of the manifold (AS17) located on a bracket (bridged) between Flanges A1 and B1 at the 9 o'clock position.

(b) Torque the flex hose nut to 135 − 150 lb−in. (15.253 − 16.948 N.m).

R
R

1 (Post SPN No. P3042) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the hose nut(s) as applicable.

(c) Install a cap assembly to the tee of the manifold and torque to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the cap assembly.

(16) Install the PT2 flex hose assembly (AS11) and a cap assembly to the EEC PT2 manifold (AS16).

(a) Remove the protection covers and install the flex hose to the tee of the manifold (AS16) located on a bracket (bridged) between Flanges A1 and B1 at the 9 o'clock position.

(b) Torque the flex hose nut to 90 − 100 lb−in. (10.169 − 11.298 N.m).

1 (Post SPN No. P3042) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the hose nut(s) as applicable.

(c) Install a cap assembly to the tee of the manifold and torque to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the cap assembly.

(17) For engines not equipped with a supplemental control unit (SCU), install a cap assembly to the tube coupling at the 12:30 o'clock position on the (AS29) tube assembly. Torque the cap assembly to 135 − 150 lb−in. (15.253 − 16.948 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the cap assembly.

(18) For engines equipped with a supplemental control unit (SCU) with multiplexing, install the PT2.5 sensing tube assembly (AS28), the PT2.5 sensing manifold assembly (AS36), and the PT2.5 sensing hose (AS38). See Figure 404.

(a) Remove the protection covers and install the PT2.5 sensing tube (AS28) to the coupling end of the (AS29) tube located at the 12:30 o'clock position. Tighten the tube nut by hand. See Figure 403, View I−I.

  1 Attach the lower end of the tube to the bracket on Flange C with a clamp and a bolt, threads lubricated with Engine Oil P03−001.

  2 Attach the remaining piece of the tube to three brackets on Flange C with clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts.

(b) Remove the protection covers and install the coupling end of the PT2.5 sensing manifold (AS36) to the (AS28) tube assembly. Tighten the tube nut by hand. Install the tee end of the manifold to the bracket on Flange B with a bolt, threads lubricated with Engine Oil P03−001 and tighten by hand.

  1 Attach the manifold to two brackets on Flange C with clamps, bolts, threads lubricated with Engine Oil P03−001 and nuts.

  2 Attach the manifold to the bracket on Flange B with a clamp, bolt, threads lubricated with Engine Oil P03−001 and a nut.

(c) Torque the eight bolts and/or nuts that attach the (AS28) tube and (AS36) manifold to brackets on Flanges B, B2 and C to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(d) Torque the tube nuts of the (AS28) tube assembly to the (AS29) tube at the 12:30 o'clock position and to the (AS36) manifold to 135 − 150 lb−in. (15.253 − 16.948 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the nuts.

(e) Torque the bolt that attaches the tee end of the manifold to a bracket on Flange B to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(f) Remove the protection covers and install the hose assembly (AS38) to the tee of the (AS36) manifold. Tighten the tube nut on the hose by hand.

(g) Torque the hose assembly nut to the manifold tee to 270 − 300 lb−in. (30.506 − 33.895 N.m).

1 (Post SPN No. P3042) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the hose nut(s) as applicable.

(h) Install a cap assembly to the tee of the manifold. Torque the cap assembly to 90 − 100 lb−in. (10.169 − 11.298 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the cap assembly.

(19) For engines equipped with a supplemental control unit (SCU), install the SCU programming plug and the SCU ground cable. See Figure 404.

(a) Install the SCU programming plug lanyard to the rearward side of the lower SCU mount bracket. Attach the lanyard to the bracket with a rivet pin and collar. Torque the hex piece of the collar until it breaks from the threaded piece of the collar.

(b) Install the SCU ground cable on the rearward side of Flange B1 at the location where the upper SCU mount bracket is attached to the flange. Attach the cable with a bolt, threads lubricated with Engine Oil P03−001, a washer and a nut. Torque the bolt to 85 − 95 lb−in. (9.604 − 10.734 N.m).

ENGINE GENERAL - FAN CASE - INSTALLATION-03

Task 72-00-33-420-002-A:

1. Install Front Fan Case For Basic Engines

A. Equipment And Materials Required

Special Tools:

PWA 76154	Adapter (2 Necessary)
PWA 76155	Sling
PWA 85676	Adapter (2 Necessary) (Optional to PWA 86423)
PWA 85677	Bracket, Handling
PWA 86423	Adapter, Lift And Trunnion (2 Necessary)
PWA 87166	Stand, Support
PWA 101960	Adapter, Support

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)

B. Procedure
See Figure 401.

CAUTION: DO NOT USE LUBRICANTS ON EEC SENSING TUBES, ADAPTERS, OR PACKINGS. CONTAMINATION OF EEC CAN RESULT.

(1) If new case is to be installed, comply with the following:

(a) Install the Flange A1 hardware as follows. Refer to 72-33-00, Assembly-20 (Task 72-33-00-430-020).

(2) Install EEC data entry plug lanyard to Flange A1 at approximately 10 o'clock position with bolt, head forward, threads lubricated with Engine Oil P03-001, washers and nut. Torque bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

ENGINE GENERAL − FAN CASE − INSTALLATION−03

(3) Remove the front fan case from the stand as follows. See Figure 402.

(a) If not installed, install either PWA 86423 Adapters or PWA 85676Adapters on the front fan case at 3 and 9 o'clock.

(b) Install PWA 76155 Sling on a hoist.

(c) Install two PWA 76154 Adapters on the sling.

(d) Install the adapters over the adapters on the front fan case. Lift the front fan case.

NOTE: If the front fan case is in horizontal (flight) position, it is permitted to use PWA 85677 Bracket at 12 o'clock as an alternative to the adapters and sling.

(4) Position inlet case to case and vane assembly aligning dowel pin in fan case with dowel pin hole in case and vane assembly. Tap fan case with fiber mallet to seat.

(5) Install the Flange B hardware as follows. Refer to 72−33−00, Assembly−21 (Task 72−33−00−430−021).

(6) Install bolt, threads lubricated with Engine Oil P03−001, and nut to secure EEC ground strap to upper front mount bracket. Torque nut to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(7) Remove hoist, bracket and adapters from fan case.

(8) Install EEC PT4.95 (AS24) and EEC PB (AS23) manifold assemblies as follows. See Figure 403.

(a) Remove protective closures and install manifolds to tube nuts at approximately 11 o'clock position rearward of Flange B1 handtight only.

(b) Install bolts, threads lubricated with Engine Oil P03−001, spacer, nuts and clamps securing manifolds to Flange B brackets and Flange B1 bracket between 9 and 10 o'clock positions. Torque all clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) For engines not equipped with propulsion multiplexer unit (PMUX), torque tube nuts rearward of of Flange B1 at approximately 10:30 o'clock position to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the nuts.

(d) For engines equipped with propulsion multiplexer unit (PMUX), torque PT4.95 tube nut to manifold coupling at approximately 10:30 o'clock position to 270 − 300 lb−in. (30.506 − 33.895 N.m) and PB tube nut to manifold coupling at approximately 10:30 o'clock position to 135 − 150 lb−in. (15.253 − 16.948 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the nuts. (Engines with PMUX incorporate smaller Diameter PB tube and manifold).

(9) Install PT4.95 (AS13) and PB (AS12) hose assemblies as follows.

(a) Install hoses to manifold tees handtight only.

(b) Install bolt, threads lubricated with Engine Oil P03−001, spacer, nut and clamps securing hose to Flange B bracket at approximately 9 o'clock position. Torque clamp bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) Torque (larger) PT4.95 hose nut to 450 − 500 lb−in. (50.843 − 56.492 N.m).

1 (Post SPN No. P3042 and Post SB PW4ENG 72−645) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the hose nut(s) as applicable.

(d) Torque (smaller) PB hose nut to 200 − 225 lb−in. (22.597 − 25.422 N.m).

(10) Install EEC PT2 (AS16) and EEC PAM (AS17) tube assemblies as follows.

(a) Remove protective closures and install tubes to adapters on Flange A1 bracket at approximately 12 o'clock position and to tube couplings at approximately 11 o'clock position handtight only.

(b) Install bolts, threads lubricated with Engine Oil P03-001, nuts and clamps securing tubes to Flange B brackets between 12 and 11 o'clock positions.

(c) Install bolt, threads lubricated with Engine Oil P03-001, nut and clamps securing tubes to Flange B1 bracket at approximately 11 o'clock position. Torque all clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(d) Torque (larger) PAM tube nuts to 270 - 300 lb-in. (30.506 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nuts.

(e) Torque (smaller) PT2 tube nuts to 135 - 150 lb-in. (15.253 - 16.948 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nuts.

(11) Install bolt, threads lubricated with Engine Oil P03-001, nut and clamp securing EEC wiring harness to Flange A1 bracket at approximately 9 o'clock position. Torque clamp bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m). See Figure 404.

NOTE: To allow for variances in harness diameter, it is permissible to select alternate clamp sizes, larger or smaller, to secure electrical harnesses and to prevent harness slipping and/or rotation. See Illustrated Parts Catalog for applicable clamp sizes.

(12) Install the Flange A1 hardware as follows. Refer to 72-33-00, Addembly-20 (Task 72-33-00-430-020).

C. Postrequisites

(1) Install electronic engine control. See 72-00-33, Installation-04 (Task 72-00-33-450-001).

(2) For engines equipped, install propulsion multiplexer unit. See 72-00-33, Installatin-09 (Task 72-00-33-450-004).

(3) Install all Stage 1 LPC blade assemblies. See 72-00-31, Installation-04 (Task 72-00-31-420-002-002).

(4) Test engine per Test Reference Table. See 71-00-00, Testing-00 (Task 71-00-00-990-003).

Task 72-00-33-420-002-B:

2. Install Front Fan Case For Engines With The Airbus/McDonnell Douglas Common Parts Configuration

A. Equipment And Materials Required

Special Tools:

PWA 76154	Adapter (2 Necessary)
PWA 76155	Sling (Optional)
PWA 85676	Adapter (2 Necessary) (Optional To PWA 86423)
PWA 85677	Bracket, Handling
PWA 86423	Adapter, Lift And Trunnion (2 Necessary)
PWA 87166	Stand, Support
PWA 101960	Adapter, Support

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)

B. Procedure
See Figure 405.

CAUTION: DO NOT USE LUBRICANTS ON THE EEC OR SCU (OPTIONAL) SENSING TUBES, ADAPTERS, OR PACKINGS. CONTAMINATION OF THE EEC OR SCU CAN RESULT.

(1) If a new case is to be installed, do the following:

(a) Install the Flange A1 hardware as follows. Refer to 72-33-00, Assembly-20 (Task 72-33-00-430-020).

(2) Remove the front fan case from the stand as follows. See Figure 406.

3. PWA 76154
4. PWA 85750
5. PWA 85678 Or PWA 87166 With PWA 101960
6. PWA 87078 Or PWA 85450

Key to Figure 402

(a) If not installed, install either PWA 86423 Adapters or PWA 85676 Adapters on the front fan case at 3 and 9 o'clock.

(b) Install PWA 76155 Sling on a hoist.

(c) Install two PWA 76154 Adapters on the sling.

(d) Install the adapters over the adapters on the front fan case. Lift the front fan case.

NOTE: If the front fan case is in the horizontal (flight) position, it is permitted to use the PWA 85677 Bracket at 12 o'clock as an alternative to the adapters and sling.

(3) Install the inlet case to the case and vane assembly by aligning the dowel pin in the fan case with the dowel pin hole in the case and vane assembly. Tap the fan case with a fiber mallet to have the case against the case and vane assembly.

(4) Install the Flange B hardware as follows. Refer to 72−33−00, Assembly−21 (Task 72−33−00−430−021).

(5) Remove hoist, bracket and adapters from the fan case.

(6) Install the EEC PT2 manifold assembly (AS16) as follows. See Figure 407.

(a) Remove the protection covers and install the tee end of the manifold to a bracket between Flanges A1 and B1 located at the 9 o'clock position. Install the opposite end of the manifold to the smaller adapter at the 12 o'clock position and tighten the manifold nut by hand.

(b) Attach the manifold (tee) to the bracket at the 9 o'clock position with a bolt, threads lubricated with Engine Oil P03−001 and tighten by hand.

Wiring Harness Installation
Figure 404
(Task 72-00-33-420-002-A)

(c) Install seven clamps to the manifold assembly at seven bracket locations on Flange B.

(7) Install the EEC PT4.95 sensing manifold assembly (AS24) as follows.

NOTE: If necessary loosen the bracket (bridged between Flanges B2 and C) to install the tube clamps and tubes (AS23) and (AS24).

(a) Remove the protection covers and install the tee end of the manifold to a bracket between Flanges A1 and B1 located at the 9 o'clock position. Install the coupling end of the manifold rearward of Flange B2 at the 10:30 o'clock position.

(b) Attach the manifold (tee) to the bracket at the 9 o'clock position with a bolt, threads lubricated with Engine Oil P03−001 and tighten by hand.

(c) Attach the manifold to a bracket on Flange B1 at the 9 o'clock position with a clamp and a bolt, threads lubricated with Engine Oil P03−001. Tighten the bolt by hand.

(d) Install a clamp to the manifold at a bracket location (bridged) between Flanges B2 and C at the 9:30 o'clock position. (Bolt is installed with the fan case harnesses).

(e) Install three clamps to the manifold assembly at three bracket locations between Flanges B2 and C.

(8) Install the EEC PAM manifold assembly (AS17) as follows.

(a) Remove the protection covers and install the tee end of the manifold to a bracket between Flanges A1 and B1 located at the 9 o'clock position. Install the opposite end of the manifold to the adapter at the 12 o'clock position and tighten the manifold nut by hand.

(b) Attach the manifold (tee) to the bracket at the 9 o'clock position with a bolt, threads lubricated with Engine Oil P03−001 and tighten by hand.

(c) Install seven clamps to the manifold assembly at seven bracket locations on Flange B.

(d) Attach the seven clamps on the EEC PT2 manifold (AS16) and the seven clamps on the EEC PAM manifold (AS17) to the brackets on Flange B with bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(e) Torque the bolt that attaches the manifold tee to the bracket at the 9 o'clock position to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(f) Torque the manifold nut to the adapter at the 12 o'clock position to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the manifold nut.

(9) Torque the EEC PT2 manifold assembly (AS16) as follows:

(a) Torque the bolt that attaches the manifold tee to the bracket at the 9 o'clock position to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(b) Torque the manifold nut to the adapter at the 12 o'clock position to 135 − 150 lb−in. (15.253 − 16.948 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the manifold nut.

(10) Install the EEC PB manifold assembly (AS23) as follows.

(a) Remove the protection covers and install the tee end of the manifold to a bracket between Flanges A1 and B1 located at the 9 o'clock position. Install the coupling end of the manifold rearward of Flange B2 at the 10:30 o'clock position.

(b) Attach the manifold (tee) to the bracket at the 9 o'clock position with a bolt, threads lubricated with Engine Oil P03−001 and tighten by hand.

(c) Attach the manifold to a bracket on Flange B1 at the 9 o'clock position with a clamp and a bolt, threads lubricated with Engine Oil P03−001. Tighten the bolt by hand.

(d) Install a clamp to the manifold at a bracket location (bridged) between Flanges B2 and C at the 9:30 o'clock position. Attach the clamps on the (AS23) and (AS24) manifolds, and the W1 harness to the bracket with a bolt, threads lubricated with Engine Oil P03−001 and nut. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

NOTE: If the bracket (bridged between Flanges B2 and C) has been loosened for installation of the tube clamps and tubes (AS23) and (AS24) do as follows. Torque again the nuts that attach the bracket to the flanges to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(e) Install three clamps to the manifold assembly at three bracket locations between Flanges B2 and C.

(f) Attach the three clamps on the PT4.95 sensing manifold (AS24) and the three clamps on the EEC PB manifold (AS23) to the three brackets located between Flanges B2 and C with nuts, threads lubricated with Engine Oil P03−001. Torque the nuts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(11) Torque the bolts that attach the tee of the EEC PB manifold (AS23) and the tee of the PT4.95 sensing manifold (AS24) to the bracket (bridged) between Flanges A1 and B1 at the 9 o'clock position to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(12) Torque the two bolts that attach the clamp on the PB sensing manifold (AS23) and the clamp on the PT4.95 sensing manifold (AS24) to the bracket on Flange B1 at the 9 o'clock position to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(13) Torque the tube nut on the (AS05) tube to the coupling on the (AS24) manifold at the 10:30 o'clock position located between Flanges B2 and C to 150 − 175 lb−in. (16.948 − 19.772 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the tube nut.

(14) Torque the tube nut on the (AS19) tube to the coupling on the (AS23) manifold at the 10:30 o'clock position located between Flanges B2 and C to 90 − 100 lb−in. (10.169 − 11.298 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the tube nut.

(15) Install the PB flex hose assembly (AS12) to the EEC PB manifold assembly (AS23) as follows.

(a) Remove the protection covers and install the flex hose to the tee of the (AS23) manifold located on a bracket (bridged) between Flanges A1 and B1 at the 9 o'clock position.

(b) Torque the flex hose nut to 270 − 300 lb−in. (30.506 − 33.895 N.m). (Post SB PW4ENG 72−645) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the hose nut(s) as applicable.

(16) Install the PT4.95 flex hose assembly (AS13) to the PT4.95 sensing manifold (AS24) as follows.

(a) Remove the protection covers and install the flex hose to the tee of the (AS24) manifold located on a bracket (bridged) between Flanges A1 and B1 at the 9 o'clock position.

(b) Torque the flex hose nut to 450 − 500 lb−in. (50.843 − 56.492 N.m).

1 (Post SPN No. P3042) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the hose nut(s) as applicable.

(17) Install the PAM flex hose assembly (AS10) to the EEC PAM manifold (AS17) as follows.

(a) Remove the protection covers and install the flex hose to the tee of the (AS17) manifold located on a bracket (bridged) between Flanges A1 and B1 at the 9 o'clock position.

(b) Torque the flex hose nut to 135 − 150 lb−in. (15.253 − 16.948 N.m).

1 (Post SPN No. P3042) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the hose nut(s) as applicable.

(18) Install the PT2 flex hose assembly (AS11) to the EEC PT2 manifold (AS16) as follows.

(a) Remove the protection covers and install the flex hose to the tee of the (AS16) manifold located on a bracket (bridged) between Flanges A1 and B1 at the 9 o'clock position.

(b) Torque the flex hose nut to 90 − 100 lb−in. (10.169 − 11.298 N.m).

1 (Post SPN No. P3042) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the hose nut(s) as applicable.

(19) For engines equipped with a supplemental control unit (SCU) with multiplexing, install the PT2.5 sensing manifold assembly (AS36) and the PT2.5 sensing hose (AS38). See Figure 408.

NOTE: The programming plug is (stayed) attached to the rear of the lower SCU mount bracket.

(a) Remove the protection covers and install the coupling end of the (AS36) manifold to the (AS28) tube assembly. Tighten the tube nut by hand. Install the tee end of the manifold to the bracket on Flange B with a bolt, threads lubricated with Engine Oil P03−001 and tighten by hand.

(b) Attach the manifold to two brackets on Flange C with clamps, bolts, threads lubricated with Engine Oil P03−001 and nuts.

(c) Attach the manifold to the bracket on Flange B2 with a clamp, bolt, threads lubricated with Engine Oil P03−001 and a nut.

(d) Attach the manifold to the bracket on Flange B with a clamp, bolt, threads lubricated with Engine Oil P03−001 and a nut.

(e) Torque the four bolts that attach the (AS36) manifold to brackets on Flange B, B2 and C to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(f) Torque the tube nut on the (AS28) tube assembly to the coupling on the (AS36) manifold at the 2 o'clock position to 135 − 150 lb−in. (15.253 − 16.948 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the tube nut.

(g) Torque the bolt that attaches the tee end of the (AS36) manifold to a bracket on Flange B to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(h) Remove the protection covers and install the hose assembly (AS38) to the tee of the (AS36) manifold. Tighten the tube nut on the hose by hand.

(i) Torque the hose assembly nut to the manifold tee to 90 − 100 lb−in. (10.169 − 11.298 N.m).

(j) (Post SPN No. P3042) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the hose nut(s) as applicable.

(20) For engines equipped with a supplemental control unit (SCU), install the ground cable as follows. See Figure 408, View F.

(a) Install the SCU ground cable on the rearward side of Flange B1 at the location where the upper SCU mount bracket is attached to the flange. Attach the cable with a bolt, threads lubricated with Engine Oil P03−001, a washer and a nut. Torque the bolt to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(21) Attach the harness (W12 without SCU or W11 with SCU) to the brackets on Flange A1 at approximately the 1 o'clock position with clamps and bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Figure 409.

(22) Attach the W2 harness to a bracket on Flange A1 at the 9:30 o'clock position with a clamp and nut, threads lubricated with Engine Oil P03−001. Torque the nut to 36 − 40 lb−in. (4.067 − 4.519 N.m).

ENGINE GENERAL − FAN CASE − INSTALLATION−03

C. Postrequisites

(1) Install electronic engine control. See 72−00−33, Installation−04 Task 72−00−33−450−001.

(2) For engines equipped, install the supplemental control unit (SCU). See 72−00−33, Installation−13 Task 72−00−33−450−008.

(3) Install all Stage 1 LPC blade assemblies. See 72−00−31, Installation−04 Task 72−00−31−420−002−002.

(4) To test the engine, see Test Reference Table. See 71−00−00, Testing−00 Task 71−00−00−990−003.

Task 72-00-33-450-001:

1. Install Electronic Engine Control

A. Equipment And Materials Necessary

Standard Tools:
Glenair TG-70 Strap Wrench Or
Glenair TG-69 Soft Jawed Pliers

Consumable Material:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire,(AS3214-02)
P11-009	Alcohol, Denatured Ethyl (AMS 3002)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	73-23-00/5/20
Packing	1	73-23-00/5/40
Packing	1	73-23-00/5/60
Packing	1	73-23-00/5/80

B. Procedure

See Figure 401.

R R R R R R R R R R R R CAUTION: BE CAREFUL WHEN YOU HANDLE, REMOVE OR INSTALL ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTIONS USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE EXTERNAL WIRE BRAID AND IN THE INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

CAUTION: USE OF LUBRICANTS ON EEC SENSING TUBES, ADAPTERS, OR PACKINGS COULD RESULT IN CONTAMINATION OF EEC.

CAUTION: INSPECT THE ENGINE FAN CASE AT APPROXIMATELY THE TEN O'CLOCK POSITION FOR A FADEC CAUTION LABEL. THIS LABEL SHOWS THAT A UNIQUE

MOUNTING EEC IS NECESSARY BECAUSE RING CASE HPC CONFIGURATION OR CUTBACK HPC STATORS ARE INSTALLED IN THE ENGINE. MAKE SURE THE CORRECT EEC IS INSTALLED.

(1) Remove protective closures.

(2) If new EEC unit is to be installed comply with the following:

(a) Install packing to adapter, and install adapter to port marked P2. Torque adapter to 65 - 75 lb-in. (7.344 - 8.474 N.m).

(b) Install packing to adapter, and install adapter to port marked PAMB. Torque adapter to 90 - 100 lb-in. (10.169 - 11.298 N.m).

(c) Install packing to adapter, and install adapter to port marked PB. Torque adapter to 110 - 120 lb-in. (12.428 - 13.558 N.m).

(d) Install packing to adapter, and install adapter to port marked P5. Torque adapter to 150 - 170 lb-in. (16.948 - 19.207 N.m).

CAUTION: IF ENGINE HAS W1 AND W2 HARNESS "WITH YELLOW BANDS", YOU MUST INSTALL AN EEC WITH THE YELLOW AND BLACK LABEL FOR RING CASE CONFIGURATION (POST SB PW4ENG 72-756 OR POST SB PW4ENG 72-759). IF YOU DO NOT INSTALL THE CORRECT HARDWARE, THE ENGINE WILL NOT OPERATE.

CAUTION: FOR ENGINES WITHOUT RING CASE CONFIGURATION (PRE SB PW4ENG 72-756 OR PRE SB PW4ENG 72-759), IT IS PERMITTED TO USE AN EEC WITH THE YELLOW AND BLACK LABEL.

(3) Position electronic engine control (EEC) to mounting brackets on fan case, at approximately the 10 o'clock position, with the four pressure sensing ports downward.

(4) (Reference 2030) Secure EEC with bolts, threads lubricated with Engine Oil P03-001. Torque bolts to 150 - 170 lb-in. (16.948 - 19.207 N.m).

CAUTION: WHEN YOU TORQUE THE FOLLOWING HOSE NUTS (AS12), (AS13), (AS10) AND (AS11), YOU MUST HOLD THE WRENCH FLATS OF THE ADAPTERS IN THE ELECTRONIC ENGINE CONTROL (EEC). THIS WILL PREVENT DAMAGE TO THE THREADS IN THE EEC.

(5) Attach front flex hose (AS12) to adapter in port marked PB. Torque flex hose nut to 200 - 225 lb-in. (22.597 - 25.422 N.m). (Post SB PW4ENG 72-645) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the PB sensing hose nut, on the EEC.

(6) Attach next flex hose (AS13) (moving rearward on fan case) to adapter in port marked P5. Torque flex hose nut to 450 - 500 lb-in. (50.843 - 56.492 N.m).

  (a) (Post SPN No. P3042) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the hose nut(s) as applicable.

(7) Attach third flex hose (AS10) rearward to adapter in port marked PAMB. Torque flex hose nut to 135 - 150 lb-in. (15.253 - 16.948 N.m).

  (a) (Post SPN No. P3042) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the hose nut(s) as applicable.

(8) Attach last flex hose (AS11) to adapter in port marked P2. Torque flex hose nut to 90 - 100 lb-in. (10.169 - 11.298 N.m).

  (a) (Post SPN No. P3042) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the hose nut(s) as applicable.

CAUTION: PRIOR TO CONNECTING GROUND CABLE TO EEC, CHECK TO ENSURE THAT CABLE MOUNTING LUGS ARE SECURE AND THAT CABLE STRANDS ARE AT LEAST 75 PERCENT UNBROKEN. LOOSE LUGS OR EXCESSIVE BREAKAGE IN CABLE STRANDS MAY RESULT IN INADEQUATE LIGHTNING STRIKE PROTECTION.

(9) Position ground strap to threaded hole in upper front corner of control and secure with bolt threads lubricated with Engine Oil P03-001. Torque bolt to 75 - 85 lb-in. (8.474 - 9.604 N.m).

CAUTION: CHECK HARNESS CONNECTOR AND/OR MATING COMPONENT CONNECTOR FOR BENT PINS AND CONTAMINATION. CAREFULLY STRAIGHTEN BENT PINS AND CLEAN CONNECTOR AS REQUIRED.

(10) Connect W1P6, W1P7, and W1P8 harness connectors to their respective connectors on rear (Channel A) of control as follows. For each connector:

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 Strap Wrench or the Glenair TG−69 Soft−Jawed Pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- The connector coupling nut is fully tight.
- The connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

(11) Connect W2P2, W2P3, and W2P4 harness connectors to their respective connectors on front (Channel B) of control as follows. For each connector:

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 Strap Wrench or the Glenair TG−69 Soft−Jawed Pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- The connector coupling nut is fully tight.
- The connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

(12) Install EEC programming plug (attached to engine by lanyard) to connector on upper left side of control as follows.

(a) Remove the protection covers. Examine the programming plug and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the plug and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

(b) Align the plug keyways and engage the plug to the mating receptacle. Tighten the plug coupling nut by hand until you cover the witness (color) band and the plug coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the plug coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN PLUG DAMAGE OR A LOOSE PLUG. A LOOSE PLUG PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 Strap Wrench or the Glenair TG−69 Soft−Jawed Pliers and tighten the plug coupling nut. Use sufficient force to be sure:
- The plug coupling nut is fully tight.
- The plug fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the plug is tight.

NOTE: If you use too much force, the tools (above) will turn around on the plug coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

C. Postrequisites

(Task 72−00−33−450−001)

Task 72-00-33-450-002:

1. Install The No. 3 Bearing Air Cooler Assembly

A. Equipment And Materials Necessary

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 Or M307

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-038	Cheesecloth, Unsized
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
	P05-292	Ferrule, Safety Cable (Optional)
R	P06-054	Paste, Antiseize (PWA 36246)
	P09-027	Sealant, Silicone Rubber (PWA 36003-2)
	P11-014	Alcohol, Isopropyl (PMC 9094)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Lockwire, AS3214-02		

B. Procedure

See Figure 401.

(1) If you do not already know if the spacer plate (called spacer) at the trailing edge of the No. 3 bearing air cooler assembly (called cooler) is the correct class of spacer, choose a classified spacer as follows.

(a) Install the cooler and a spacer on the intermediate case. Use workbolts.

(b) Measure the distance between the trailing edge of the cooler and the intermediate case. If the installed spacer does not give the correct fit, choose a spacer that does. Refer to Index 2 of the figure and Table 401.

(c) Remove the cooler and spacer.

(2) (Post SB PW4ENG 72-433) If removed, attach the two supports along the axial edges of the cooler with 14 bolts, threads lubricated with Engine Oil P03-001, and nuts.

Class	Spacer Thickness - Inch (mm)
1	0.022 - 0.028 (0.559 - 0.711)
2	0.036 - 0.044 (0.914 - 1.118)
3	0.058 - 0.068 (1.473 - 1.727)
4	0.075 - 0.085 (1.905 - 2.159)
5	0.095 - 0.105 (2.413 - 2.667)
6	0.120 - 0.130 (3.048 - 3.302)

Spacer Plate Thickness - Table 401

(3) (Reference 1004) Install the cooler as follows.

(a) Assemble the strut and one rod end bearing and nut, with the threads lubricated with Engine Oil P03-001, to Dimension AD. Tighten the nut with your hand.

(b) Install the rod end bearing in the bracket at 2 o'clock on the intermediate case. Attach the bearing to the intermediate case with a bolt and nut, threads lubricated with Engine Oil P03-001. Torque nut to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(c) Remove protective closures from ends of cooling tubes.

(d) Attach the mount bracket to the bracket at the front of the cooler with two bolts, lubricated with Engine Oil P03-001. Tighten the bolts with your hand.

(e) (Pre SB PW4ENG 72-433) Put the cooler and correct classified spacer in the correct position on the intermediate case.

1 Attach the cooler to the intermediate case with eight screws, lubricated with Engine Oil P03-001. Torque the screws to 36 - 40 lb-in. (4.067 - 4.519 N.m).

2 Do a check of the cooler. It must agree with Index 2 of the referenced figure. If not, remove the cooler and choose a new spacer.

(f) Assemble the remaining rod end bearing and nut, threads lubricated with Engine Oil P03-001, to the strut. Tighten the nut with your hand.

(g) Attach the outer rod end bearing to the mount bracket with a bolt lubricated with Engine Oil P03-001. Tighten the bolt with your hand.

(h) After final adjustment, examine the inspection holes on the strut. Obstruction of the holes indicates correct engagement.

(i) Torque the nuts at either end of the strut to 75 - 85 lb-in. (8.474 - 9.604 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 the nuts.

(j) Torque the bolt that attaches the outer rod end bearing to the mount bracket to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(k) Torque the bolts that attach the mount bracket to the cooler bracket to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(l) (Post SB PW4ENG 72-433) Install the cooler as follows:

1 Loosen the 14 bolts and nuts in the supports at the axial edges of the cooler.

2 Install the cooler and spacer on the intermediate case.

3 Measure the distance between the cooler and the intermediate case at the trailing edge. If necessary, choose a new spacer for the correct fit. Refer to the figure.

4 Tighten the bolts and nuts in the supports to 85 - 95 lb-in. (9.604 - 10.734 N.m).

5 Attach the cooler with eight screws, lubricated with Engine Oil P03-001. Torque the screws to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(m) Apply sealant around the edges of the cooler at AL as follows:

1 Make a piece of clean Cheesecloth P05-038 wet with Alcohol P11-014. Clean the edges of the cooler.

2 Dry the cleaned areas fully in the adjacent air. There must not be any alcohol remaining on the surfaces.

3 In less than two hours after you cleaned the parts, fill the spaces at AL with Sealant P09-027.

4 Cure the sealant in adjacent air that has a 25 percent relative humidity, minimum, for eight hours, minimum, before you run the engine.

(4) Attach cooling air tubes to adapters lubricated with
R Antiseize Paste P06-054, on cooler. Wipe off unwanted
R paste. Torque tube nuts to 825 - 900 lb-in. (93.212 - 101.686 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 the tube nuts.

C. Postrequisites

(1) Test engine per Test Reference Table. See 71-00-00, Testing-00 (Task 71-00-00-990-003).

No. 3 Bearing Air Cooler Assembly And Support
Figure 401 (Sheet 2)
(Task 72-00-33-450-002)

ENGINE GENERAL - FAN CASE - INSTALLATION-06

Task 72-00-33-450-003-A:

1. Install EEC Fan Case Wiring Harnesses W1 and W2 For Basic Engines

NOTE: This procedure provides for installation of the EEC fan case wiring harnesses W1 and W2 when the fan case is installed to the intermediate case.

A. Prerequisites

(1) If it is necessary to install a new access cover, refer to Repair-02 Task 72-00-33-300-002 for instructions on the installation of boltholes in the cover.

B. Equipment And Materials Required

Standard Tools:
Glenair TG-70 Strap Wrench or
Glenair TG-69 Soft Jawed Pliers
No. 10 Torq-set Drive

Special Tools:
PWA 86157 Box, Simulator
PWA 86158 Box, Simulator
PWA 86159 Bar, Simulator
PWA 86211 Panel, Simulator
PWA 86212 Panel, Simulator

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-099	Tape, Moisture Resistant, Green (PMC 4141)
P05-124	Ties, Twist
P09-019	Sealant, Flame Resistant Silicone Rubber (PWA 36751-1)
P09-027	Sealant, Silicone Rubber (PWA 36003-2)
P11-009	Alcohol, Denatured Ethyl (AMS 3002)
P18-007	Primer, Silicone (PWA 36086-2)

C. Procedure
See Figure 401, Figure 402,
Figure 403,
Figure 404, Figure 405, Figure 406, Figure 407, Figure 408,
Figure 409 and Figure 410.

ENGINE GENERAL − FAN CASE − INSTALLATION−06

CAUTION: SEE 72−00−00, INSTALLATION−00 FOR NECESSARY GENERAL INSTALLATION INSTRUCTIONS ABOUT THE WIRING HARNESSES, LEADS, AND CABLES.

CAUTION: DO NOT TWIST OR BEND THE HARNESSES BADLY DURING THE INSTALLATION OR DAMAGE TO THE HARNESSES CAN RESULT.

(1) Measure the W1 harness from the W1P25 harness connector and make a mark per dimension given in Figure 410 (Sheet 2).

(2) Measure the W2 harness from the W2J9 harness connector and make a mark per dimension given in Figure 410 (Sheet 2).

(3) Set the W1 and W2 wiring harnesses on the left side of the fan case and down through the intermediate case strut at 12 o'clock position. Keep the W1 harness to the right of the strut and the W2 harness to the left of the strut. Continue to set harnesses on to the HPC case. See Figure 401 for harness routing.

(4) Adjust harness positions and temporarily install Twist Ties P05−124 to attach the harnesses to engine brackets.

(5) Install the EEC over the harnesses and attach with work bolts temporarily.

(6) Connect the W1 and W2 harness connectors (given below) to the mating harness receptacles as follows. See Figure 402 for connector locations. For each connector:

CAUTION: IF ENGINE HAS THE HPC RING CASE CONFIGURATION (POST SB PW4ENG 72−756), MAKE SURE YOU INSTALL THE CORRECT W1 AND W2 HARNESS, PROGRAMMING PLUG AND EEC. IF YOU DO NOT INSTALL THE CORRECT HARDWARE, THE ENGINE WILL NOT OPERATE.

(a) If W1 and W2 harness have yellow bands, you must have an EEC with the yellow and black label (For Ring Case Configuration). (See Figure 409).

(b) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

(c) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is hand tight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(d) Use the Glenair TG−70 strap wrench or the Glenair TG−69 soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

(e) Connect the W1P6, W1P7, and W1P8 harness connectors to the J6, J7, and J8 receptacles on the rear side of the EEC (Channel A).

(f) Connect the W2P2, W2P3, and W2P4 harness connectors to the J2, J3, and J4 receptacles on the front side of the EEC (Channel B).

NOTE: Be sure that each of the leads for all the connectors go out of the W1 and W2 harnesses as shown.

(g) Connect the W2P20 harness connector (if equipped) to the receptacle on the PMUX.

(h) Connect the W2P26 harness connector to the W5J26 harness receptacle attached to the HPC case bracket at approximately 12 o'clock position.

(i) Attach the W2J9 harness receptacle to the same HPC case bracket with the retaining bracket and two bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(j) Connect the W1P10 and W1P11 harness connectors to the receptacles of the solenoid at approximately 1 o'clock position above Flange E.

(k) Connect the W1P25 harness connector to the W4J25 harness receptacle attached to the HPC case bracket at approximately 1:30 o'clock position.

(l) Connect the W1P9 harness connector to the W2J9 harness receptacle attached to the HPC case bracket at approximately 12 o'clock position.

(m) Connect the W1P24 harness connector to the W3J24 harness receptacle attached to the HPC bracket at approximately 10 o'clock position.

(7) Attach the simulator panels to fan case as follows. See Figure 411.

(a) Install a PWA 86157 Pylon Interface Simulator Box to bolt holes 4 and 5, 116 and 117 on Flange B2, removing existing bolts at some locations to attach simulator to the flange. Secure the box to the corresponding bolt holes on Flange A1.

(b) Install a PWA 86158 Electrical Junction Box Simulator to bolt holes 108 through 110 on Flange B1. Secure the box to the flange with the receptacles pointing downward and attach it to the corresponding bolt holes on Flange A1.

(c) Install a PWA 86211 Inlet Cowl Simulator Panel to bolt holes 4 and 5 on the rear face of Flange A. Secure the panel to the flange with bolts and detail knobs.

(d) Install a PWA 86212 Junction Box Simulator Panel to bolt holes 104 and 106 on Flange A1 and the corresponding bolt holes on Flange B1. Secure the panel to the flange with bolts and washers and if required, spacers between Flange A1 and the panel.

(e) Attach the connector ends of the EEC harnesses to the proper receptacles on the simulators.

(8) Adjust the W1 and W2 harnesses for any necessary clearance as required. Install the clamps at all clamp points. Refer to figures. Attach the clamps loosely to the engine with bolts and/or nuts, threads lubricated with Engine Oil P03−001. Remove the Twist Ties P05−124 previously installed to position harnesses.

NOTE: Use different clamp sizes on the wiring harnesses to prevent harness movement when tightened. See the Illustrated Parts Catalog for selection of clamp sizes and part numbers.

(9) Attach the harnesses through the intermediate case strut as follows. See Figure 405.

(a) Make sure the upper front grommet is installed forward of the EEC sensing tubes at the top of the strut.

(b) Install the upper middle and rear grommets to the harnesses at the top of the strut. Install one bolt, threads lubricated with Engine Oil P03−001, and washer (Pre SB PW4ENG 72−145) or plate (Post SB PW4ENG 72−145). Tighten the bolt by hand.

(c) Install the lower center grommets and lower right and left clamp segments to the harnesses at the bottom of the strut. Attach each of the clamp segments to the intermediate case with two screws, threads lubricated with Engine Oil P03−001, and one bracket. Tighten screws by hand.

(d) Adjust the harnesses through the strut so that the harnesses are not loose. Make sure the marks previously made on each harness align with the rear surface of the clamps that attach the harnesses to the Flange E brackets. See Figure 410 (Sheet 2).

(e) Torque the clamp bolts that attach both harnesses to the intermediate case below the strut and to the Flange E brackets to 36 − 40 lb−in. (4.067 − 4.519 N.m). Remove all looseness from the harnesses through the strut area out the top of the strut.

(f) Tighten the four screws that attach the lower clamp segments. Loosen the screws one turn. Torque the screws to 22 lb−in. (2.486 N.m) plus the torque required to turn the screw through the locking property. The maximum torque for the screw is 40 lb−in. (4.519 N.m). Make sure the remaining screw holes in the clamp segment bracket align with the intermediate case screw holes.

(g) (Reference 2011) Tighten the upper grommet bolt at top of strut until locking property of nut is felt. Tighten bolt 10 complete turns more.

(10) Install a PWA 86159 Vee−band Anchor Fitting Simulator Bar to the outer fan case Vee−groove at the 12 o'clock position. Check the clearance of the harnesses as they cross the Vee−groove and travel under the Vee−band simulator bar. Adjust the harness as required to obtain a proper fit.

(11) Adjust harnesses for clearances and torque all the remaining clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(12) Tie harnesses and examine clearances as shown in Figure 410.

(13) Remove the EEC and torque the clamp bolts that were under the EEC to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(14) Disconnect the harness connectors from the simulator boxes and panels.

(15) Remove the simulators from the engine.

(16) Replace the previously removed bolts, washers and nuts to the open holes in the flange brackets. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

CAUTION: BE SURE TO USE THE CORRECT PART NUMBER ACCESS COVER AND COVER PLATE. INTERCHANGEABILITY IS AFFECTED. REFER TO SB PW4ENG 72−161 AND SB PW4ENG 72−370.

(17) For engines that are post SB PW4ENG 72−161 and have only the fan exit fairing access covers (412/5) removed, install the access covers (412/5) and the rear cover plate (412/1) as follows. Use a No. 10 Torq−set drive. See Figure 412.

(a) (Post SB PW4ENG 72−370) If the access covers (412/5) you install are new, bond washers to the two boltholes (412/6) that are at the bottom of the covers as follows. If the access covers you install are not new, skip this step.

1 Use the washers that were on the covers you removed. Use the same quantity of washer, in the same positions, on the new covers as on the old covers.

NOTE: Refer to the Standard Practices Manual, 70−48, for the cleaning procedures that follow.

2 Clean the areas the sealant will touch with PWA 83−D4, but do not use trichlorotrifluoroethane.

3 With Sealant P09−027, make a fillet all around the edges of the washers. Sealant is not permitted between the washers and the intermediate case nor between the washers and the fairing access covers.

4 Cure the sealant in air that is at room temperature, and has a relative humidity of 25 percent, for four hours before you touch it.

(b) Install the two access covers (412/5) to the fan exit fairing (412/2) with the four screws (412/6) and two screws (412/7), and if applicable two screws (412/4) lubricated with Engine Oil P03−001.

(c) Tighten the four screws (412/6) against the two covers (412/5) and then loosen them one complete turn. Tighten the four screws (412/7) and (412/4) against the two covers (412/5) and then loosen them one complete turn.

(d) Install the (rear) cover plate (412/1) to the fan exit fairing (412/2) with the six screws (412/3), lubricated with Engine Oil P03−001.

(e) Tighten the screws (412/3) against the cover plate (412/1) then loosen them one complete turn. Torque the screws (412/3) to 22 lb−in. (2.486 N.m) plus the torque necessary to turn them through the locking feature of the nuts. The maximum torque is 40 lb−in. (4.519 N.m).

(f) Torque the four screws (412/6) to 22 lb−in. (2.486 N.m) plus the torque necessary to turn them through the locking feature of the nuts. The maximum torque is 40 lb−in. (4.519 N.m).

(g) Torque the four screws (412/7) and (412/4) to 22 lb−in. (2.486 N.m) plus the torque necessary to turn them through the locking feature of the nuts. The maximum torque is 40 lb−in. (4.519 N.m).

(18) Apply sealant to Area AL. See Figure 413.

NOTE: Refer to the Standard Practices Manual, 70−48, for the cleaning procedures that follow.

(a) Clean the areas the sealant will touch. Use PWA 83−D4, but do not use trichlorotrifluoroethane.

(b) Apply Primer P18−007 to all cleaned surfaces.

1 It is necessary to apply the primer in less than two hours after you cleaned the area.

2 The primer must cure in air at ambient temperature for two hours, minimum. The air must have a relative humidity of 25 percent, minimum.

(c) Apply Sealant P09−019.

1 It is necessary to apply the sealant from 2 − 24 hours after you applied the primer.

2 Use a hot air gun at 175° − 225°F (79.° − 107.°C) for 5 − 7 minutes to dry the sealant.

3 After the hot air gun, cure the sealant in air that has a relative humidity of 25 percent, minimum, for eight hours, minimum, before you touch the parts.

(19) Apply sealant to Area AM:

(a) Clean the areas the sealant will touch. Use PWA 83−D4, but do not use trichlorotrifluoroethane.

(b) Apply Sealant P09−027. Cure the sealant in air that is at room temperature, and has a relative humidity of 25 percent, minimum, for eight hours, minimum, before you touch the parts.

D. Postrequisites

(1) For engines with the fan exit fairings disassembled from the intermediate case, install the fairings. See Installation−14 Task 72−00−33−450−009.

(2) Install the fan exit liner segments (inner rear) that you removed. Refer to 72−00−33, Installation−16 Task 72−00−33−440−001.

(3) Install the electronic engine control (EEC). See Installation−04 Task 72−00−33−450−001.

5. 0.380 Inch (9.652 mm) Minimum Clearance Required Between The W2 Harness And The W2P4 Connector Screws.

Key to Figure 410 (Sheet 1)

Task 72-00-33-450-003-B:

2. Install EEC Fan Case Wiring Harnesses W1, W2, W11 (SCU only) And W12 For Engines With Airbus/McDonnell Douglas Common Parts Configuration

NOTE: This procedure provides for installation of the EEC fan case wiring harnesses W1, W2, W11 (SCU only) and W12 when the fan case is installed to the intermediate case.

A. Prerequisites

(1) If it is necessary to install a new access cover, refer to Repair-02 Task 72-00-33-300-002 for instructions on the installation of boltholes in the cover.

B. Equipment And Materials Required

Standard Tools:
Glenair TG-70 Strap Wrench or
Glenair TG-69 Soft Jawed Pliers
No. 10 Torq-set Drive

Special Tools:
PWA 86211 Panel, Simulator
PWA 86212 Panel, Simulator

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-099	Tape, Moisture Resistant, Green (PMC 4141)
P05-124	Ties, Twist
P09-019	Sealant, Flame Resistant Silicone Rubber (PWA 36751-1)
P09-027	Sealant, Silicone Rubber (PWA 36003-2)
P11-009	Alcohol, Denatured Ethyl (AMS 3002)
P18-007	Primer, Silicone (PWA 36086-2)

ENGINE GENERAL − FAN CASE − INSTALLATION−06

1. Tie
2. Cross Tie
3. 0.375 Inch (9.525 mm) Clearance Required Between The W2 Wiring Harness And The Inlet Variable Vane Unison Ring.

Key to Figure 410 (Sheet 2)

C. Procedure
See Figure 414, Figure 415, Figure 416, Figure 417, Figure 418, Figure 419, Figure 420, Figure 421, Figure 422, Figure 423, Figure 424 and Figure 425.

CAUTION: SEE 72−00−00, INSTALLATION−00 FOR NECESSARY GENERAL INSTALLATION INSTRUCTIONS ABOUT THE WIRING HARNESSES, LEADS, AND CABLES.

CAUTION: DO NOT TWIST OR BEND THE HARNESSES BADLY DURING THE INSTALLATION OR DAMAGE TO THE HARNESSES CAN RESULT.

(1) Install the (inboard) clamp segment at the 10 o'clock position between Flanges B1 and B2. Attach the clamp segment to the flange brackets with two bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Figure 423.

(2) Put the W1 and W2 wiring harnesses on the left side of the fan case and down through the intermediate case strut at the 12 o'clock position. Keep the W1 harness to the right of the strut and the W2 harness to the left of the strut. See Figure 414 and Figure 415 for the routing of the harness.

(3) Adjust the harness positions and install Twist Ties P05−124 to temporarily attach the harnesses to the engine brackets.

(4) Temporarily install the EEC over the harnesses and attach to the fan case brackets with work bolts.

(5) Temporarily connect the W1 and W2 harness connectors (given below) to the mating harness receptacles as follows. See Figure 416 and Figure 417. For each connector:

1. Apply The Sealant Even With, To 0.010 Inch (0.254 mm) Below, Two Places

Fan Exit Fairing (Bifurcation) Sealant Areas
Figure 413
(Task 72−00−33−450−003−A)

CAUTION: IF ENGINE HAS THE HPC RING CASE CONFIGURATION (POST SB PW4ENG 72−756), MAKE SURE YOU INSTALL THE CORRECT W1 AND W2 HARNESS, PROGRAMMING PLUG AND EEC. IF YOU DO NOT INSTALL THE CORRECT HARDWARE, THE ENGINE WILL NOT OPERATE.

(a) If W1 and W2 harness have yellow bands, you must have an EEC with the yellow and black label (For Ring Case Configuration). (See Figure 429).

(b) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

(c) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is hand tight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(d) Use the Glenair TG−70 strap wrench or the Glenair TG−69 soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

(e) Connect the W1P6, W1P7, and W1P8 harness connectors to the J6, J7, and J8 receptacles on the rear side of the EEC (Channel A).

(f) Connect the W2P2, W2P3, and W2P4 harness connectors to the J2, J3, and J4 receptacles on the front side of the EEC (Channel B).

NOTE: Be sure that each of the leads for all the connectors go out of the W1 and W2 harnesses as shown.

(6) Adjust the W2 harness from the clamp segment (under EEC) to the three connectors on the EEC. At the 9:30 o'clock position install two clamps on the harness, one clamp to a bracket on Flange A1 and one clamp to a bracket on Flange B1. Attach clamps to brackets with nuts, threads lubricated with Engine Oil P03−001. Torque the nuts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Figure 423.

(7) Adjust the W1 harness from the clamp segment (under EEC) to the three connectors on the EEC. At the 9:30 o'clock position install two clamps on the harness, one clamp to a bracket on Flange B1 and one clamp to a bracket on Flange B2. Upward from the last installed clamps, install four clamps on the harness, three clamps to brackets on Flange C and one small clamp to a bracket on Flange B2. Attach clamps to brackets with bolts and/ or nuts, threads lubricated with Engine Oil P03−001. Torque the bolts and/or nuts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Figure 423.

(8) Disconnect the six connectors from the EEC receptacles. Remove the EEC from the fan case.

(9) Adjust the W1 and W2 harnesses through the (inboard) clamp segment at the 10 o'clock position. Install the (outboard) clamp segment over the harnesses and to the (inboard) clamp segment. Attach segments together with bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Figure 423.

(10) Connect the W1 and W2 harness connectors (given below) to the mating harness receptacles as follows. See Figure 426 and Figure 427. For each connector:

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is hand tight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 strap wrench or the Glenair TG−69 soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

(d) Connect the W1P6, W1P7, and W1P8 harness connectors to the J6, J7, and J8 receptacles on the rear side of the EEC (Channel A).

(e) Connect the W2P2, W2P3, and W2P4 harness connectors to the J2, J3, and J4 receptacles on the front side of the EEC (Channel B).

(f) Connect the W2P26 harness connector to the W5J26 harness receptacle attached to the HPC case bracket at approximately 12 o'clock position.

(g) Attach the W2J9 harness receptacle to the same HPC case bracket with the retaining bracket and two bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(h) Connect the W1P10 and W1P11 harness connectors to the receptacles of the solenoid at approximately 1 o'clock position above Flange E.

(i) Connect the W1P25 harness connector to the W4J25 harness receptacle attached to the HPC case bracket at approximately 1:30 o'clock position.

(j) Connect the W1P9 harness connector to the W2J9 harness receptacle attached to the HPC case bracket at approximately 12 o'clock position.

(k) Connect the W1P24 harness connector to the W3J24 harness receptacle attached to the HPC bracket at approximately 10 o'clock position.

(l) Install W1J36 and W2J37 harness receptacles to a bracket between Flanges B1 and B2 at approximately the 1:30 o'clock position. Attach the receptacles to the bracket with a retaining bracket and two bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Figure 424.

(11) Attach the fan case simulator panels as follows. See Figure 426.

(a) Install a PWA 86211 Inlet Cowl Simulator Panel to bolts holes 4 and 5 on the rear face of Flange A. Secure the panel to the flange with bolts and detail knobs.

(b) Install a PWA 86212 Junction Box Simulator Panel to bolt holes 104 and 106 on Flange A1 and the corresponding bolt holes on Flange B1. Secure the panel to the flange with bolts and washers and if required, spacers between Flange A1 and the panel.

(c) Attach the connector ends of the EEC harness to the receptacles on the simulators. Adjust the harness as necessary to obtain the proper fits and clearances.

(12) Adjust the remaining portion of the W1 and W2 harnesses for any necessary clearance as required. Install the clamps at the remaining clamp points. Refer to figures. Attach the clamps loosely to the engine with bolts and/ or nuts, threads lubricated with Engine Oil P03−001. Remove the Twist Ties P05−124 previously installed to position harnesses.

NOTE: Use different clamp sizes on the wiring harnesses to prevent harness movement when tightened. See the Illustrated Parts Catalog for selection of clamp sizes and part numbers.

(13) Attach the harnesses through the intermediate case strut as follows. See Figure 420.

(a) Make sure the upper front grommet is installed forward of the EEC sensing tubes at the top of the strut.

(b) Install the upper middle and rear grommets to the harnesses at the top of the strut. Install one bolt, threads lubricated with Engine Oil P03−001, and plate. Tighten the bolt by hand.

(c) Install the lower center grommets and lower right and left clamp segments to the harnesses at the bottom of the strut. Attach each of the clamp segments to the intermediate case with two screws, threads lubricated with Engine Oil P03−001, and one bracket. Tighten screws by hand.

(d) Adjust the harnesses through the strut so that the harnesses are not loose.

(e) Torque the clamp bolts that attach both harnesses to the intermediate case below the strut and to the Flange E brackets to 36 − 40 lb−in. (4.067 − 4.519 N.m). Remove all looseness from the harnesses through the strut area out the top of the strut.

(f) Tighten the four screws that attach the lower clamp segments. Loosen the screws one turn. Torque the screws to 22 lb−in. (2.486 N.m) plus the torque required to turn the screw through the locking property. The maximum torque for the screw is 40 lb−in. (4.519 N.m). Make sure the remaining screw holes in the clamp segment bracket align with the intermediate case screw holes.

(g) (Reference 2011) Tighten the upper grommet bolt at top of strut until locking property of nut is felt. Tighten bolt 10 complete turns more.

(14) Adjust the W1 and W2 harnesses for clearances. Torque the remaining bolts and/or nuts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(15) Disconnect the harness connectors from the simulator panels. Remove the panels from the engine.

(16) For engines without the supplemental control unit (SCU), install the W12 wiring harness on the upper right side of the fan case as follows. See Figure 424.

(a) Connect the W12P37 harness connector to the W1J36 harness receptacles at the 1:30 0'clock position.

1 Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

2 Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is hand tight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

3 Use the Glenair TG−70 strap wrench or the Glenair TG−69 soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure: − the connector coupling nut is fully tight − the connector fits tightly against the receptacle (metal to metal). This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque. See the instructions given with the strap wrench for correct use.

(b) Adjust the harness and install clamps to the harness. Attach the clamps to brackets with bolts and/or nuts, threads lubricated with Engine Oil P03−001. Torque the bolts and/or nuts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(17) For engines with the supplemental control unit (SCU), install the W11 wiring harness on the upper right side of the fan case as follows. See Figure 425.

(a) Connect the W11 harness connectors (given below) to the mating harness receptacles as follows. For each connector:

1 Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

2 Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is hand tight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

3 Use the Glenair TG−70 strap wrench or the Glenair TG−69 soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure: − the connector coupling nut is fully tight − the connector fits tightly against the receptacle (metal to metal). This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque. See the instructions given with the strap wrench for correct use.

(b) Connect the W11P37 connector to the W2J37 receptacle and connect the W11P36 connector to the W1J36 receptacle located at the 1:30 o'clock position.

(c) Connect the W11P34 connector to the J2 receptacle and the W11P33 connector to the J3 receptacle on the SCU.

(d) Install the W11J32 harness receptacle to a bracket on Flange B1 at the 3 o'clock position. Attach the receptacle to the bracket with a retaining bracket and two bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(e) Adjust the harness and install clamps to the harness. Attach the clamps to brackets with bolts and/or nuts, threads lubricated with Engine Oil P03−001. Torque the bolts and/or nuts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

CAUTION: BE SURE TO USE THE CORRECT PART NUMBER ACCESS COVER AND COVER PLATE. INTERCHANGEABILITY IS AFFECTED. REFER TO SB PW4ENG 72−161 AND SB PW4ENG 72−370.

(18) Install the fan exit fairing access covers (427/5) and the rear cover plate (427/1) as follows. Use a No. 10 Torq−set drive. See Figure 427.

(a) (Post SB PW4ENG 72−370) If the access covers (412/5) you install are new, bond washers to the two boltholes (412/6) that are at the bottom of the covers as follows. If the access covers you install are not new, skip this step.

1 Use the washers that were on the covers you removed. Use the same quantity of washer, in the same positions, on the new covers as on the old covers.

NOTE: Refer to the Standard Practices Manual, 70−48, for the cleaning procedures that follow.

2 Clean the areas the sealant will touch with PWA 83−D4, but do not use trichlorotrifluoroethane.

3 With Sealant P09−027, make a fillet all around the edges of the washers. Sealant is not permitted between the washers and the intermediate case nor between the washers and the fairing access covers.

4 Cure the sealant in air that is at room temperature, and has a relative humidity of 25 percent, for four hours before you touch it.

(b) Install the two access covers (427/5) to the fan exit fairing (427/2) with the four screws (427/6), two screws (427/7), and if applicable two screws (412/4), lubricated with Engine Oil P03−001.

(c) Tighten the four screws (427/6) against the two covers (427/5) and then loosen them one complete turn. Tighten the four screws (427/7) and (427/4) against the two covers (427/5) and then loosen them one complete turn.

(d) Install the (rear) cover plate (427/1) to the fan exit fairing (427/2) with the six screws (427/3), lubricated with Engine Oil P03−001.

(e) Tighten the screws (427/3) against the cover plate (427/1) then loosen them one complete turn. Torque the screws (427/3) to 22 lb−in. (2.486 N.m) plus the torque necessary to turn them through the locking feature of the nuts. The maximum torque is 40 lb−in. (4.519 N.m).

(f) Torque the four screws (427/6) to 22 lb−in. (2.486 N.m) plus the torque necessary to turn them through the locking feature of the nuts. The maximum torque is 40 lb−in. (4.519 N.m).

(g) Torque the four screws (427/7) and (427/4) to 22 lb−in. (2.486 N.m) plus the torque necessary to turn them through the locking feature of the nuts. The maximum torque is 40 lb−in. (4.519 N.m).

(19) Apply sealant to Area AL. See Figure 428.

NOTE: Refer to the Standard Practices Manual, 70−48, for the cleaning procedures that follow.

(a) Clean the areas the sealant will touch. Use PWA 83−D4, but do not use trichlorotrifluoroethane.

(b) Apply Primer P18−007 to all cleaned surfaces.

1 It is necessary to apply the primer in less than two hours after you cleaned the area.

2 The primer must cure in air at ambient temperature for two hours, minimum. The air must have a relative humidity of 25 percent, minimum.

(c) Apply Sealant P09−019.

1 It is necessary to apply the sealant from 2 − 24 hours after you applied the primer.

2 Use a hot air gun at 175° − 225°F (79.° − 107.°C) for 5 − 7 minutes to dry the sealant.

3 After the hot air gun, cure the sealant in air that has a relative humidity of 25 percent, minimum, for eight hours, minimum, before you touch the parts.

(20) Apply sealant to Area AM:

(a) Clean the areas the sealant will touch. Use PWA 83−D4, but do not use trichlorotrifluoroethane.

(b) Apply Sealant P09−027. Cure the sealant in air that is at room temperature, and has a relative humidity of 25 percent, minimum, for eight hours, minimum, before you touch the parts.

D. Postrequisites

(1) For engines with the fan exit fairings disassembled from the intermediate case, install the fairings. See Installation−14 Task 72−00−33−450−009.

(2) Install the fan exit liner segments (inner rear) that you removed. Refer to 72−00−33, Installation−16 Task 72−00−33−440−001.

(3) Install the electronic engine control (EEC). See Installation−04 Task 72−00−33−450−001.

ENGINE GENERAL − FAN CASE − INSTALLATION−07

Task 72−00−33−420−005:

1. Install Bleed Valve Assembly

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P09−014	Sealant, Silicone Rubber (PWA 36003)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIGURE	ITEM
Cotter Pin	1	72−33−00	12	150
Cotter Pin	1	72−33−00	12	130
Cotter Pin	1	72−33−00	12	160

B. Procedure

(1) Install 2.5 bleed valve aligning rollers with slotted guides and bell crank with bell crank bracket on fan case. Secure bell crank to bracket with pin and cotter pins. Bend tangs of cotter pins to secure pin.

(2) Install pin to secure bell crank and actuator link. Secure pin with collar and cotter pin. Bend tangs of cotter pin to secure pin.

(3) Clean both installed pin and cotter pin surrounding areas by SPOP 208 Wipe Method (Task 70−21−00−110−040). Surfaces shall be thoroughly dried in air at ambient temperature. Drying time shall be sufficient to remove traces of solvent detrimental to sealant. Apply Silicone Rubber Sealant (P09−014), to both ends of pins and cotter pins.

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72-00-33-420-004:

1. Install The Fan Exit Base And Vane Assemblies

A. Equipment And Materials

Special Tools:

PWA 76154	Adapter, Lift And Trunnion (2 Necessary)
PWA 76155	Sling, Strongback
PWA 85698	Adapter, Lift And Trunnion (2 Necessary) (Optional to PWA 86431)
PWA 86431	Adapter, Lift And Trunnion (2 Necessary)

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P09-029	Sealant, Silicone Rubber (PWA 36029)

B. Procedure

WARNING: VANES MUST BE REPLACED INDIVIDUALLY (ONE-FOR-ONE) TO PREVENT DISENGAGEMENT OF ADJACENT VANES. IF SEVERAL VANES ARE REMOVED AT ONE TIME, ADJACENT VANES MAY DISENGAGE FROM INNER CASE AND FALL. POSSIBLE INJURY TO PERSONNEL AND DAMAGE TO VANE MAY RESULT.

CAUTION: REPLACEMENT VANE MUST BE SAME PART NUMBER AS REPLACED VANE.

Subtask 72-00-33-360-071:

(1) Replace individual vanes as necessary.

(a) Carefully lift retention strap at vane location. Pull vane radially out and forward to disengage from inner case locating pins.

(2) Install two PWA 86431 Adapters or PWA 85698 Lifting Adapters on the front fan case and outer case at 3 and 9 o'clock positions. With a hoist, PWA 76155 Sling, and two PWA 76154 Adapters, lift the front fan case. See Figure 401.

ENGINE GENERAL - FAN CASE - INSTALLATION-08

CAUTION: INSTALL THE FRONT FAN CASE AND OUTER CASE SUFFICIENTLY TO THE REAR TO PREVENT THE VANES FROM DISENGAGEMENT AND DAMAGE.

(3) Install the front fan case and outer case over the vanes on engine sufficiently to remove retention strap. See Figure 402.

(4) Remove vane retention strap from OD of vanes.

(5) Move fan cases and fan exit case rearward to mate with intermediate case.

(6) Install the Flange C hardware as follows. Refer to 72-00-33, Installation-20 (Task 72-00-33-420-020).

(7) Attach the vanes to the outer case. See Figure 402.

(a) FOR THESE MODELS: 4152, 4156A, 4158
(Pre SB PW4ENG 72-262) Apply Engine Oil P03-001 to the threads of two bolts. Attach the outer case to the vanes with two washers and the bolts. Torque the bolts to 74 - 82 lb-in. (8.361 - 9.265 N.m). Install Lockwire P05-289.

(b) FOR THESE MODELS: 4152, 4156A, 4158
(Post SB PW4ENG 72-262) Apply Engine Oil P03-001 to the threads of two slab-bolts. Install the bolts through the vane, outer fairing, and outer case. Install washers and nuts on the bolts. Torque the nuts to 85 - 95 lb-in. (9.604 - 10.34 N.m).

(c) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Apply Engine Oil P03-001 to the threads of two slab-bolts. Install the bolts through the vane, outer fairing, and outer case. Install washers and nuts on the bolts. Torque the nuts to 85 - 95 lb-in. (9.604 - 10.34 N.m).

NOTE: FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Engines with the common Airbus-McDonnell Douglas fan case externals sales order option have eight brackets attached to the slab-bolts at the top left of the outer case. To install these brackets, first put the brackets and mating bolts in position over the slab-bolts, then install the nuts

(no washers at these positions). Tighten the nuts to the same torque as above.

(d) FOR THESE MODELS: 4152, 4156A, 4158
(Post SB PW4ENG 72-262) Clean and fill the holes where the heads of the slab-bolts are, as follows:

1 FOR THESE MODELS: 4152, 4156A, 4158
R Clean the surfaces the sealant will touch. Use
R PWA 83-D4 (Task 70-48-00-360-001). Refer to
R Section 70-48-00 in the Standard Practices Manual, PN 585005.

2 FOR THESE MODELS: 4152, 4156A, 4158
Fill the hole with Silicone Rubber Sealant P09-029. The sealant must be 0.040 inch (1.016 mm) above or below the adjacent surfaces.

NOTE: FOR THESE MODELS: 4152, 4156A, 4158
Do the fill operation at room temperature in a room that has 25 percent minimum relative humidity.

NOTE: FOR THESE MODELS: 4152, 4156A, 4158
It is permitted to have 0.060 inch (1.524 mm) surface voids in the rubber sealant.

(e) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Clean and fill the holes where the heads of the slab-bolts are, as follows:

Subtask 72-00-33-360-001-013:

1 FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Clean the surfaces the sealant will touch. Use
R PWA 83-D4 (Task 70-48-00-360-001). Refer to
R Section 70-48-00, in the Standard Practices Manual, PN 585005.

Subtask 72-00-33-360-051:

2 FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Fill the hole with Silicone Rubber Sealant P09-029. The sealant must be 0.040 inch (1.016 mm) above or below the adjacent surfaces.

NOTE: FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Do the fill operation at room

temperature in a room that has 25 percent minimum relative humidity.

NOTE: FOR THESE MODELS: 4152-3, 4156A-3, 4158-3 It is permitted to have 0.060 inch (1.524 mm) surface voids in the rubber sealant.

(8) Optional, apply Sealant P09-029 in the space between the ID and OD bases of the base and vane assemblies and the adjacent surfaces as follows: See Figure 403.

NOTE: The optional sealant can be applied to help reduce erosion of the vane base material.

(a) Remove any loose sealant.

(b) Clean the areas that the sealant will touch. Refer to PWA 83-D4 (Task 70-48-00-360-001) in section 70-48, Standard Practices Manual, PN 585005.

NOTE: The fan exit guide vane base material is polyetherimide.

(c) Apply Sealant P09-029 to the spaces between the ID and OD vane bases (fairings), and adjacent surfaces as shown in the reference figure. The surface of the sealant must be smooth and continuous and flush to 0.040 inch (1.016 mm) below the adjacent surface.

(d) Remove excess sealant.

(e) Permit the sealant to cure in air with a relative humidity of 50 percent minimum at 75° F (23.9° C) or equivalent. Cure the sealant for 24 hours, minimum, before you touch the sealant.

NOTE: The sealant is fully cured in 72 hours.

C. Postrequisites

(1) Install fan case external plumbing. See Installation-02 (Task 72-00-33-420-003-A) of (Task 72-00-33-420-003-B00) as applicable.

ENGINE GENERAL − FAN CASE − INSTALLATION−08

(2) Install EEC wiring harnesses W1 and W2. See Installation−06 (Task 72−00−33−450−003−A) or (Task 72−00−33−450−003−B) as applicable.

(3) Install all Stage 1 LPC blade assemblies. See Installation−04 (Task 72−00−31−420−002−002).

ENGINE GENERAL - FAN CASE - INSTALLATION-09

Task 72-00-33-450-004:

1. Install Propulsion Multiplexer Unit (PMUX)

A. Equipment And Materials Required

Standard Tools:

Glenair TG-70 Strap Wrench or
Glenair TG-69 Soft Jawed Pliers

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P11-009	Alcohol, Denatured Ethyl (AMS 3002)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	77-31-00/1/20
Lockwire, AS3214-02	As Required	

B. Procedure
See Figure 401.

CAUTION: DO NOT USE LUBRICANTS ON PMUX SENSING TUBES, ADAPTERS, OR PACKINGS. CONTAMINATION OF PMUX CAN RESULT.

(1) If unit has been replaced or repaired and adapter was removed, comply with the following.

(a) Remove protective closures and install packing to adapter. Install adapter to port in unit and torque to 65 - 75 lb-in. (7.344 - 8.474 N.m).

(2) Lubricate the threads on the mounting bolts with Engine Oil P03-001. Install the unit, connections facing downward, to brackets on Flange B and Flange B2 at approximately the 1 o'clock position with a spacer between each bracket and the unit. Secure the spacers and the unit with bolts and washers. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(3) Connect the harness connector to the PMUX harness receptacle as follows.

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is hand tight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 Strap Wrench or the Glenair TG−69 Soft−Jawed Pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- The connector coupling nut is fully tight
- The connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

(4) Connect the PMUX programming plug to the receptacle on the PMUX as follows.

(a) Remove the protection covers. Examine the programming plug and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the plug and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

(b) Align the plug keyways and engage the plug to the mating receptacle. Tighten the plug coupling nut by hand until you cover the witness (color) band and the plug coupling nut is hand tight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the plug coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN PLUG DAMAGE OR A LOOSE PLUG. A LOOSE PLUG PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 Strap Wrench or the Glenair TG−69 Soft−Jawed Pliers and tighten the plug coupling nut. Use sufficient force to be sure:
- The plug coupling nut is fully tight
- The plug fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the plug is tight.

NOTE: If you use too much force, the tools (above) will turn around on the plug coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

CAUTION: HOLD ADAPTER WITH WRENCH WHILE TORQUING FLEX HOSE NUT, TO AVOID DAMAGE TO MULTIPLEXER PORT.

(5) Attach flex hose (AS32) and torque hose nuts to 135 − 150 lb−in. (15.253 − 16.948 N.m).

(a) (Post SPN No. P3042) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the hose nut(s) as applicable.

(6) Install bolt, threads lubricated with Engine Oil P03−001, and nut securing ground cable to top of unit. Torque bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

ENGINE GENERAL - FAN CASE - INSTALLATION-10

Task 72-00-33-450-005:

1. Install PMUX Programming Plug

A. Equipment And Materials Required

Standard Tools:
Glenair TG-70 Strap Wrench or
Glenair TG-69 Soft Jawed Pliers

Consumable Materials

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P11-009	Alcohol, Denatured Ethyl (AMS 3002)

B. Procedure

See Figure 401.

(1) If the PMUX programming plug requires programming to change engine serial number, refer to PMUX Programming Plug Component Maintenance Manual 77-32-11, PN 50A638.

(2) Connect the PMUX programming plug to the receptacle on the PMUX as follows.

(a) Remove the protection covers. Examine the programming plug and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the plug and receptacle with Denatured Ethyl Alcohol (P11-009). Let dry.

(b) Align the plug keyways and engage the plug to the mating receptacle. Tighten the plug coupling nut by hand until you cover the witness (color) band and the plug coupling nut is hand tight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the plug coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN PLUG DAMAGE OR A LOOSE PLUG. A LOOSE PLUG PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the (Glenair TG-70) strap wrench or the (Glenair TG-69) soft-jawed pliers and tighten the plug coupling nut. Use sufficient force to be sure:

- the plug coupling nut is fully tight
- the plug fits tightly against the receptacle (metal to metal).

This procedure will make sure the contacts are sufficiently engaged and the plug is tight.

NOTE: If you use too much force, the tools (above) will turn around on the plug coupling nut. This will prevent too much torque.

See the instructions given with the strap wrench for correct use.

(3) Install lanyard to forward side of Flange B bracket with bolt, threads lubricated with Engine Oil (P03−001), and nut. Torque bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

ENGINE GENERAL - FAN CASE - INSTALLATION-11

Task 72-00-33-450-006:

1. Install 2.5 Bleed Valve Actuator

A. Equipment And Materials Required

Standard Tools:

Glenair TG-70 Strap Wrench or
Glenair TG-69 Soft Jawed Pliers
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 85928	Torque Adapter

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P11-009	Alcohol, Denatured Ethyl (AMS 3002)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	75-32-00/1/140
Packing	1	75-32-00/1/160

B. Procedure
See Figure 401.

(1) Remove protective closures.

(2) If actuator has been replaced or repaired and adapters were removed comply with the following:

(a) Remove protective closures and install packings lubricated with Engine Oil P03-001, to adapters. Install adapters, threads lubricated with Engine Oil P03-001, to ports in actuator and torque adapter to 150 - 170 lb-in. (16.948 - 19.207 N.m) and adapter to 110 - 120 lb-in. (12.428 - 13.558 N.m).

CAUTION: DO NOT ROTATE BLEED VALVE ROD END CLEVIS. ROTATING CLEVIS MAY CAUSE DAMAGE TO BLEED VALVE LINKAGE.

(3) Lubricate OD threads of rod end clevis with Engine Oil P03−001, and slide hollow piston shaft of actuator over protruding rod end clevis. Rotate piston shaft hex clockwise to engage OD threads of rod end clevis with ID threads of piston shaft. Continue rotating until actuator is mated with intermediate case.

CAUTION: WITH THE PWA 85928 TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING (SEE STANDARD PRACTICES MANUAL). TOO MUCH TORQUE CAN DAMAGE THE THREADED PARTS.

(4) Secure actuator to intermediate case using bolts, threads lubricated with Engine Oil P03−001 and washers. Use PWA 85928 Torque Adapter and torque bolts to 180 − 200 lb−in. (20.337 − 22.597 N.m).

(5) For engines with the 2.5 bleed actuator support bracket (Post SB PW4ENG 75−84) do the following.

(a) Install the support bracket to the actuator with bolts, threads lubricated with Engine Oil P03−001. Tighten the bolts by hand.

(b) (Post SB PW4ENG 75−84 and Pre SB PW4ENG 75−126) Align the three boltholes in the support bracket with the three boltholes in the bracket on Flange E. Attach the two brackets together with nuts and bolts, threads lubricated with Engine Oil P03−001. Tighten the nuts by hand.

(c) (Post SB PW4ENG 75−126) Align the three boltholes in the support bracket with the three boltholes in the bracket on Flange E. Attach the two brackets together with bolts, threads lubricated with Engine Oil P03−001 and installed in the nutplates on the support bracket.

(d) Torque the bolts that attach the support bracket to the actuator 65 − 85 lb−in. (7.344 − 9.604 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the bolts.

ENGINE GENERAL − FAN CASE − INSTALLATION−11

(e) Torque the bolts that attach the support bracket to bracket on Flange E to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(6) Connect the W3P15 harness connector to the 2.5 bleed valve harness receptacle as follows.

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is hand tight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 Strap Wrench or the Glenair TG−69 Soft Jawed Pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

NOTE: Install the inner liner. Refer to 72-00-33, Installation-16 Task 72-00-33-440-001. Install the hydraulic tubes. Refer to 72-00-00, Special Procedures-03 Task 72-00-00-830-001 or 72-00-00, Special Procedure-24 Task 72-00-00-830-006 after the rigging.

C. Postrequisites

(1) Rig 2.5 bleed valve actuator. See 72-00-00, Special Procedures-03 Task 72-00-00-830-001 to manually rig the bleed valve actuator or 72-00-00, Special Procedure-24 Task 72-00-00-830-006 to hydraulically rig the bleed valve actuator.

ENGINE GENERAL - FAN CASE - INSTALLATION-12

Task 72-00-33-450-007-A:

1. Install The EEC Programming Plug

A. Equipment And Materials Required

Standard Tools:
Glenair TG-70 Strap Wrench or
Glenair TG-69 Soft Jawed Pliers

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P11-009	Alcohol, Denatured Ethyl (AMS 3002)

B. Procedure
See Figure 401.

CAUTION: WHEN YOU REPLACE THE EEC PROGRAMMING PLUG, EXAMINE THE REPLACEMENT PLUG. BE SURE THAT THE REPLACEMENT PLUG IS THE SAME CLASS AND THE SAME PART NUMBER AS THE REMOVED PLUG.

(1) Connect the EEC programming plug to the EEC plug receptacle as follows.

(a) Remove the protection covers. Examine the programming plug and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the plug and receptacle with Denatured Ethyl Alcohol (P11-009). Let dry.

(b) Align the plug keyways and engage the plug to the mating receptacle. Tighten the plug coupling nut by hand until you cover the witness (color) band and the plug coupling nut is hand tight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the plug coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN PLUG DAMAGE OR A LOOSE PLUG. A LOOSE PLUG PERMITS VIBRATION AND CAN RESULT IN

CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the (Glenair TG−70) strap wrench or the (Glenair TG−69) soft−jawed pliers and tighten the plug coupling nut. Use sufficient force to be sure:
- the plug coupling nut is fully tight
- the plug fits tightly against the receptacle (metal to metal).

This procedure will make sure the contacts are sufficiently engaged and the plug is tight.

NOTE: If you use too much force, the tools (above) will turn around on the plug coupling nut. This will prevent too much torque.

See the instructions given with the strap wrench for correct use.

(2) Attach the lanyard to the inlet case Flange A1 with the bolt, lubricated with Engine Oil (P03−001), washers (under bolthead and nut), and nut. Torque the nut to 36 − 40 lb−in. (4.067 − 4.519 N.m).

C. Postrequisites

(1) Test the engine per Test Reference Table. See 71−00−00, Adjustment/Test−00.

Task 72−00−33−450−007−B:

2. Install The EEC Programming Plug For Engines With Commonality Parts Between Airbus And McDonnell Douglas

A. Equipment And Materials Required

Standard Tools:
Glenair TG−70 Strap Wrench or
Glenair TG−69 Soft Jawed Pliers

Expendable Parts:

ENGINE GENERAL - FAN CASE - INSTALLATION-13

Task 72-00-33-450-008:

1. Install The Supplemental Control Unit

A. Equipment And Materials Required

Standard Tools:
Glenair TG-70 Strap Wrench or
Glenair TG-69 Soft Jawed Pliers
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P06-035	Fluid, Lubricating
P11-009	Alcohol, Denatured Ethyl (AMS 3002)

Expendable Parts:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIGURE	ITEM
Packing, AS3208-04				

B. Procedure

See Figure 401.

(1) Remove the protection covers from the openings and the electrical connectors on the supplemental control unit and the wiring harness.

CAUTION: DO NOT USE LUBRICANTS ON THE SENSING HOSE, ADAPTER, OR GASKET UNLESS SPECIFIED DIFFERENTLY. LUBRICANTS CAN CAUSE CONTAMINATION OF THE SCU.

(2) If a new supplemental control unit is to be installed, do the following.

Supplemental Control Unit
Figure 401
(Task 72−00−33−450−008)

(a) Install a packing (410/4), lubricated with Lubricating Fluid (P06−035), onto an adapter (401/5). Install the adapter into the opening at the data plate end of the supplemental control unit. Torque the adapter to 65 − 75 lb−in. (7.344 − 8.474 N.m).

(b) If the supplemental control unit does not have the multiplexing option, install the cap assembly (410/10) to the adapter (410/5) at the data plate end of the supplemental control unit. Torque the cap assembly to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire (P05−289) or Safety Cable (P05−291) and Safety Cable Ferrule (P05−292) the cap assembly.

(3) If a new supplemental control unit does not have the auto−start option and the unit is to be replaced, install two protective caps (401/6) to the electrical connectors identified as J1 and J5. Carefully push the caps into the receptacles and tighten the cap assemblies by hand. Install the Lockwire (P05−289) or Safety Cable (P05−291) and Safety Cable Ferrule (P05−292) the protective caps.

(4) Put the supplemental control unit to the mounting brackets on the fan case at approximately the 2:30 o'clock position with the electrical connectors pointing rearward. Attach the supplemental control unit to the brackets with four bolts and washers (401/8), threads lubricated with Engine Oil (P03−001). Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

CAUTION: BEFORE YOU CONNECT THE GROUND CABLE TO THE SCU, EXAMINE THE CABLE MOUNTING LUGS TO MAKE SURE THE LUGS ARE SECURED TO THE CABLE AND THE CABLE WIRE (STRANDS) ARE AT LEAST 75 PERCENT NOT BROKEN. LOOSE LUGS OR TOO MANY BROKEN WIRES (STRANDS) CAN NOT GIVE SUFFICIENT PROTECTION FROM A LIGHTNING STRIKE.

(5) Put the ground cable to the threaded hole in the top rear side of the supplemental control unit. Attach the cable to the supplemental control unit with a bolt (401/9), threads lubricated with Engine Oil (P03−001). If the ground cable was removed from Flange B1, put the opposite end of the ground cable to the bolt hole on Flange B1. Attach the cable to the flange with a bolt, threads lubricated with Engine Oil (P03−001), washer

and nut. Torque the two bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

CAUTION: DO NOT USE LUBRICANTS ON THE SENSING HOSE, OR GASKET UNLESS SPECIFIED DIFFERENTLY. LUBRICANT CAN CAUSE CONTAMINATION OF THE SCU.

(6) If the supplemental control unit has the multiplexing option, install the top hose connector of the hose assembly (401/3) to the adapter (401/5) at the bottom side of the supplemental control unit. Torque the hose connector to 270 − 300 lb−in. (30.506 − 33.895 N.m).

(7) Connect the W11P34 (401/1) and the W11P33 (401/2) harness connectors to the mating SCU harness receptacles as follows. For each connector:

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol (P11−009). Let dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the (Glenair TG−70) strap wrench or the (Glenair TG−69) soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).

This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

See the instructions given with the strap wrench for correct use.

(8) Connect the SCU programming plug (401/7) to the mating SCU receptacle as follows.

(a) Remove the protection covers. Examine the programming plug and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the plug and receptacle with Denatured Ethyl Alcohol (P11−009). Let dry.

(b) Align the plug keyways and engage the plug to the mating receptacle. Tighten the plug coupling nut by hand until you cover the witness (color) band and the plug coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the plug coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN PLUG DAMAGE OR A LOOSE PLUG. A LOOSE PLUG PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the (Glenair TG−70) strap wrench or the (Glenair TG−69) soft−jawed pliers and tighten the plug coupling nut. Use sufficient force to be sure:
- the plug coupling nut is fully tight
- the plug fits tightly against the receptacle (metal to metal).

This procedure will make sure the contacts are sufficiently engaged and the plug is tight.

NOTE: If you use too much force, the tools (above) will turn around on the plug coupling nut. This will prevent too much torque.

See the instructions given with the strap wrench for correct use.

C. Postrequisites

(1) Test the engine as specified in the Test Reference Table. See 71−00−00, Adjustment/Test−00.

Previous Pageblock Return to Previous Menu Next Pageblock

ENGINE GENERAL - FAN CASE - INSTALLATION-14

Task 72-00-33-450-009:

1. Install The Fan Exit (Bifurcation) Fairing Assemblies (Pre SB PW4ENG 72-370)

A. Prerequisites

(1) If the fan cases were removed for the complete removal of the fairings, install the fan cases with the fairings in position. See Installation-01 (Task 72-00-33-420-001).

(2) If it is necessary to install a new access cover, refer to Repair-02 (Task 72-00-33-300-002) for instructions on the installation of boltholes in the cover.

B. Equipment And Materials Required

Standard Tools:
No. 3 Cross-Drive (Phillips)
No. 10 Torq-set Drive

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P09-019	Sealant, Flame Resistant Silicone Rubber (PWA 36751-1)
P09-027	Sealant, Silicone Rubber (PWA 36003-2)
P18-007	Primer, Silicone (PWA 36086-2)

C. Procedure

NOTE: Use a No. 3 cross-drive (Phillips) with the shoulder screws. Use a No. 10 Torq-set drive with all the other screws.

(1) Remove the lockwire that temporarily holds the fairings in position.

CAUTION: BE SURE TO USE THE CORRECT PART NUMBERS. INTERCHANGEABILITY IS AFFECTED. REFER TO SB PW4ENG 72-161.

CAUTION: BE VERY CAREFUL WHEN YOU INSTALL THE INNER FAIRINGS. IT IS POSSIBLE THAT THERE ARE WASHERS ATTACHED TO THE FAIRINGS. IT IS EASY

FOR THESE WASHERS TO BECOME DISCONNECTED FROM THE FAIRINGS.

(2) Install the fairings loosely. See Figure 401.

(a) Align the fan exit inner (bifurcation) fairing assembly (called inner fairing) (401/2), with the gasket (401/5), around the bottom of the 12 o'clock strut. Be sure the forward ends of the inner fairing overlap the previously installed front liner segments correctly.

(b) Install the countersunk screws (401/3), lubricated with Engine Oil (P03-001), in all the inner fairing boltholes except the two larger boltholes (401/4) near the rear of the inner fairing. Tighten the screws with your hand.

(c) (Post SB PW4ENG 72-161) Attach the two access covers (401/6) with screws (401/7) and (401/8), lubricated with Engine Oil (P03-001). Tighten the screws with your hand.

(d) Install the two shoulder screws (401/4), lubricated with Engine Oil (P03-001), in the inner fairing. Tighten the shoulder screws against the fairing (401/2).

(e) Tighten all the screws (401/3) against the fairing.

(f) (Post SB PW4ENG 72-161) Tighten the screws (401/7) and (401/8) against the access covers (401/6).

(3) (Reference 1012) Do a check of the clearance of the inner fairing at Flange D. Refer to Inspection/Check-05 (Task 72-00-33-210-004).

(4) Continue to install the fairings loosely. See Figure 401.

(a) Loosen the screws (401/4), (401/3), (401/7) and (401/8) one full turn.

(b) Install the fan exit outer (bifurcation) fairing assembly (called outer fairing) (401/1). Attach the outer fairing to the inner fairing with screws (401/9), lubricated with Engine Oil (P03-001). Tighten the screws with your hand.

(Task 72−00−33−450−009)

(c) Attach the outer fairing (401/1) to the outer case with the screws (401/11) and shoulder screws (401/10), lubricated with Engine Oil (P03−001). Tighten the screws with your hand.

(d) Tighten all the outer fairing screws (401/10), (401/11), and (401/9) in the same sequence given. Loosen all the screws (401/10), (401/11), and (401/9) in the same sequence given, one full turn.

(e) Install the cover plate (401/12). Attach the cover plate to the inner and outer fairings with screws (401/13), lubricated with Engine Oil (P03−001). Tighten the screws against the cover, then loosen them one full turn.

(5) Torque the screws as follows.

(a) Torque the cover plate screws (401/13) to 22 lb−in. (2.486 N.m) plus the torque necessary to turn the screw through the self−locking feature. The maximum torque is 40 lb−in. (4.519 N.m).

(b) Torque the four shoulder screws (401/4) and (401/10) to 22 lb−in. (2.486 N.m) plus the torque necessary to turn the screw through the self−locking feature. The maximum torque is 95 lb−in. (10.734 N.m).

(c) Torque the other inner and outer fairing screws (401/3), (401/11), and (401/9), in the same sequence given, to 22 lb−in. (2.486 N.m) plus the torque necessary to turn the screw through the self−locking feature. The maximum torque is 40 lb−in. (4.519 N.m).

(d) (Post SB PW4ENG 72−161) Torque the access cover screws (401/7) and (401/8), in the same sequence given, to 22 lb−in. (2.486 N.m) plus the torque necessary to turn the screw through the self−locking feature. The maximum torque is 40 lb−in. (4.519 N.m).

(6) Apply sealant to Area AL. See Figure 402.

NOTE: Refer to the Standard Practices Manual, 70−48, for the cleaning procedures that follow.

Fan Exit (Bifurcation) Fairing Assembly Sealant Areas
Figure 402 (Sheet 1)
(Task 72−00−33−450−009)

1. Apply The Sealant Even With, To 0.010 Inch (0.254 mm) Above, Surface R.
2. Apply The Sealant Even With, To 0.010 Inch (0.254 mm) Below, All Around The Access Cover, Two Places

Key To Figure 402 (Sheet 1)

(a) Clean the areas the sealant will touch. Use PWA 83−D4, but do not use trichlorotrifluoroethane.

(b) Apply Primer (P18−007) to all cleaned surfaces.

1 It is necessary to apply the primer in less than two hours after you cleaned the area.

2 The primer must cure in air at ambient temperature for two hours, minimum. The air must have a relative humidity of 25 percent, minimum.

(c) Apply Sealant (P09−019).

1 It is necessary to apply the sealant from 2 − 24 hours after you applied the primer.

2 Use a hot air gun at 175° − 225°F (79.° − 107.°C) for 5 − 7 minutes to dry the sealant.

3 After the hot air gun, cure the sealant in air that has a relative humidity of 25 percent, minimum, for eight hours, minimum, before you touch the parts.

(7) Apply sealant to Area AM:

(a) Clean the areas the sealant will touch. Use PWA 83−D4, but do not use trichlorotrifluoroethane.

(b) Apply Sealant (P09−027). Dry the sealant in air that is at room temperature, and has a relative humidity of 25 percent, minimum, for eight hours, minimum, before you touch the parts.

Fan Exit (Bifurcation) Fairing Assembly Sealant Areas
Figure 402 (Sheet 2)
(Task 72−00−33−450−009)

Task 72−00−33−450−009−A:

2. Install The Fan Exit (Bifurcation) Fairing Assemblies (Post SB PW4ENG 72−370)

A. Prerequisites

(1) If it is necessary to install a new access cover, refer to Repair−02 (Task 72−00−33−300−002) for instructions on the installation of boltholes in the cover.

B. Equipment And Materials Required

Standard Tools:
No. 3 Cross−Drive (Phillips)
No. 10 Torq−set Drive
T−10 Torx Tip

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)
P09−019	Sealant, Flame Resistant Silicone Rubber (PWA 36751−1)
P09−027	Sealant, Silicone Rubber (PWA 36003−2)
P18−007	Primer, Silicone (PWA 36086−2)

Expendable Parts:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIGURE	ITEM
Washer	AR	73−33−00	9	585

C. Procedure

NOTE: Unless otherwise specified, use a No. 3 cross−drive (Phillips) with the shoulder screws and a No. 10 Torq−set drive with all the other screws.

CAUTION: BE SURE TO USE THE CORRECT PART NUMBERS. INTERCHANGEABILITY IS AFFECTED. REFER TO SB PW4ENG 72−161, SB PW4ENG 72−370, AND SB PW4ENG 72−414.

BE VERY CAREFUL WHEN YOU INSTALL THE INNER FAIRINGS. IT IS POSSIBLE THAT THERE ARE WASHERS ATTACHED TO THE FAIRINGS. IT IS EASY FOR THESE WASHERS TO BECOME DISCONNECTED FROM THE FAIRINGS.

(1) Install the fairings loosely. See Figure 403.

(a) Install the gasket (403/16), open end rearward, around the bottom of the 12 o'clock strut.

(b) Install the left and right fan exit inner (bifurcation) fairing side panels (called side panels) (403/3) over the gasket. Install the countersunk screws (403/5), lubricated with Engine Oil (P03−001), in the four forward boltholes. Tighten the screws with your hand.

(c) Install the fan exit inner (bifurcation) fairing leading edge (called leading edge) (403/2) to overlap the side panels. Be sure the forward ends of the leading edge overlap the previously installed front liner segments correctly.

1 Attach the leading edge to the case. Install the screws (403/15), lubricated with Engine Oil (P03−001), in the boltholes. Tighten the screws with your hand.

2 Attach the leading edge to the side panels. Install the screws (403/4), lubricated with Engine Oil (P03−001), in the boltholes. Tighten the screws with your hand.

(d) Attach the two access covers (403/8) with screws (403/7) and (403/9), and if applicable (403/9A), lubricated with Engine Oil (P03−001). Tighten the screws with your hand.

NOTE: The side panels, leading edge, and access covers together are called the inner fairings.

(e) Install the two shoulder screws (403/6), lubricated with Engine Oil (P03−001), in the side panels. Tighten the shoulder screws against the panels (403/3).

Fan Exit (Bifurcation) Fairing Assembly
Figure 403 (Sheet 2)
(Task 72−00−33−450−009−A)

(f) Tighten the countersunk screws (403/5) of the side panels.

(g) Tighten the screws (403/4) and (403/15) of the leading edge.

NOTE: Use Torx tip T−10 with screws (403/4).

(h) Tighten the screws (403/7) and (403/9) agains the access covers.

(2) (Reference 1012) Do a check of the clearance between the trailing edge of the leading edge and the front of the side panels. Refer to Inspection/Check−05 (Task 72−00−33−210−004).

(3) Continue to install the fairings loosely. See Figure 403.

(a) Loosen the screws (403/6), (403/5), (403/15), (403/4), (403/7) and (403/9) one full turn.

(b) Tighten the screws (403/7), (403/9), and if applicable (403/9A), of the access covers against the covers (403/8). Loosen them one full turn.

(c) Install the fan exit outer (bifurcation) fairing assembly (called outer fairing) (403/1). Attach the outer fairing to the inner fairings with screws (403/12), lubricated with Engine Oil (P03−001). Tighten the screws with your hand.

(d) Attach the outer fairing (403/1) to the outer case with the screws (403/14) and shoulder screws (403/13), lubricated with Engine Oil (P03−001). Tighten the screws with your hand.

(e) Tighten all the outer fairing screws (403/13), (403/14), and (403/12) in the same sequence given. Loosen all the screws (403/13), (403/14), and (403/12) in the same sequence given, one full turn.

(f) Install the cover plate (403/10). Attach the cover plate to the inner and outer fairings with screws (403/11), lubricated with Engine Oil (P03−001). Tighten the screws against the cover, then loosen them one full turn.

(g) The fairings must be sufficiently loose to permit radial movement. If they are not, loosen the screws another quarter turn.

(4) (Reference 1010) Torque the cover plate screws (403/11).

(a) Torque the cover plate screws (403/11) to 22 lb−in. (2.486 N.m) plus the torque necessary to turn the screw through the self−locking feature. The maximum torque is 40 lb−in. (4.519 N.m).

(5) (Reference 1010) Adjust the height of the fairings/ cover plate as follows. See Figure 404.

(a) Lower the fairings/cover plate assembly against the intermediate case platform, while you keep to the dimensions in Figure 404.

(b) If there are gaps under the flaps of the side panels and access covers, install washers at the screws called BH.

(c) Bond the washers to the intermediate case as follows.

NOTE: Refer to the Standard Practices Manual, 70−48, for the cleaning procedures that follow.

1 Clean the areas with PWA 83−D4, but do not use trichlorotrifluoroethane.

2 With Sealant (P09−027), make a fillet all around the edges of the washers. Sealant is not permitted between the washers and the intermediate case nor between the washers and the fairing access covers.

3 Cure the sealant in air that is at room temperature, and has a relative humidity of 25 percent, for four hours before you touch it.

(6) (Reference 1010) Torque the remaining screws as follows. See Figure 403.

Fan Exit (Bifurcation) Fairing Assembly
(Reference 1010)
Figure 404
(Task 72−00−33−450−009)

(a) Torque the access cover screws (403/9) and, if applicable (403/9A), to 22 lb−in. (2.486 N.m) plus the torque necessary to turn the screw through the self−locking feature. The maximum torque is 40 lb−in. (4.519 N.m).

(b) Torque the two shoulder screws (403/6) in the side panels to 22 lb−in. (2.486 N.m) plus the torque necessary to turn the screw through the self−locking feature. The maximum torque is 95 lb−in. (10.734 N.m).

(c) Torque the inner fairing screws (403/5), (403/15), and (403/7) that attach the fairings/access covers to the case to 22 lb−in. (2.486 N.m) plus the torque necessary to turn the screw through the self−locking feature. The maximum torque is 40 lb−in. (4.519 N.m).

(d) Torque the two shoulder screws (403/13) in the outer fairing to 22 lb−in. (2.486 N.m) plus the torque necessary to turn the screw through the self−locking feature. The maximum torque is 95 lb−in. (10.734 N.m).

(e) Torque the remaining outer fairing screws (403/14) that attach the outer fairing to the case. Torque them to to 22 lb−in. (2.486 N.m) plus the torque necessary to turn the screw through the self−locking feature. The maximum torque is 40 lb−in. (4.519 N.m).

(f) Examine the position of the cover plate to be sure that the dimensions in Figure 404 are still true. If necessary, loosen all the screws but the cover plate screws (403/11), and start again at step (3).

(g) Torque the leading edge screws (403/4) that attach the leading edge to the side panels to 22 lb−in. (2.486 N.m) plus the torque necessary to turn the screw through the self−locking feature. The maximum torque is 40 lb−in. (4.519 N.m).

NOTE: Use Torx tip T−10.

(h) Torque the outer fairing screws (403/12) that attach the outer fairing to the inner fairings to to 22 lb−in. (2.486 N.m) plus the torque necessary to turn the screw through the self−locking feature. The maximum torque is 40 lb−in. (4.519 N.m).

(7) Apply sealant to Area AL. See Figure 405.

NOTE: Refer to the Standard Practices Manual, 70−48, for the cleaning procedures that follow.

(a) Clean the areas the sealant will touch. Use PWA 83−D4, but do not use trichlorotrifluoroethane.

(b) Apply Primer (P18−007) to all cleaned surfaces.

1 It is necessary to apply the primer in less than two hours after you cleaned the area.

2 The primer must cure in air at ambient temperature for two hours, minimum. The air must have a relative humidity of 25 percent, minimum.

(c) Apply Sealant (P09−019).

1 It is necessary to apply the sealant from 2 − 24 hours after you applied the primer.

2 Use a hot air gun at 175° − 225°F (79.° − 107.°C) for 5 − 7 minutes to dry the sealant.

3 After the hot air gun, cure the sealant in air that has a relative humidity of 25 percent, minimum, for eight hours, minimum, before you touch the parts.

(8) Apply sealant to Area AM:

(a) Clean the areas the sealant will touch. Use PWA 83−D4, but do not use trichlorotrifluoroethane.

(b) Apply Sealant (P09−027). Dry the sealant in air that is at room temperature, and has a relative humidity of 25 percent, minimum, for eight hours, minimum, before you touch the parts.

ENGINE GENERAL - FAN CASE - INSTALLATION-15

Task 72-00-33-450-010:

1. Install The Supplemental Control Unit (SCU) Programming Plug

A. Equipment And Materials Required

Standard Tools:
Glenair TG-70 Strap Wrench or
Glenair TG-69 Soft Jawed Pliers

Consumable Materials:

Item No.	Designation
P11-009	Alcohol, Denatured Ethyl (AMS 3002)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIGURE	ITEM
Collar (ST2185-06)	1			
Pin-Rivet (ST1106-02)	1			

B. Procedure
See Figure 401.

NOTE: Inside the programming plug, the engine serial number is identified (by electronics) to a specified engine (by serial number). Programming plugs are not interchangeable with each other unless a new plug is made to the same engine serial number.

(1) Connect the SCU programming plug to the mating SCU receptacle as follows.

(a) Remove the protection covers. Examine the programming plug and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the plug and receptacle with Denatured Ethyl Alcohol (P11-009). Let dry.

(b) Align the plug keyways and engage the plug to the mating receptacle. Tighten the plug coupling nut by hand until you cover the witness (color) band and the plug coupling nut is hand tight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the plug coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN PLUG DAMAGE OR A LOOSE PLUG.
A LOOSE PLUG PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the (Glenair TG−70) strap wrench or the (Glenair (TG−69) soft−jawed pliers and tighten the plug coupling nut. Use sufficient force to be sure:
- the plug coupling nut is fully tight
- the plug fits tightly against the receptacle (metal to metal).

This procedure will make sure the contacts are sufficiently engaged and the plug is tight.

NOTE: If you use too much force, the tools (above) will turn around on the plug coupling nut. This will prevent too much torque.

See the instructions given with the strap wrench for correct use.

(2) Attach the lanyard to the lower (rearward) mount bracket for the SCU with a rivet pin and collar. See 70−43−00, Standard Practices Manual.

Task 72-00-33-440-001:

1. Install The Fan Exit Liner Segment Assemblies (Procedure To Use With The Installation Of A Component)

A. Equipment And Materials

Standard Tools:
No. 10 Torq-set Drive

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-038	Cheesecloth, Unsized (GA-100-11)
P05-137	Bonding Preventative, Teflon S (PWA 36038)
P05-231	Tape, Adhesive Transfer (PWA 36745)
P09-014	Sealant, Silicone Rubber (PWA 36003)
P09-019	Sealant, Flame Resistant Silicone Rubber (PWA 36751-1)
P09-029	Sealant, Silicone Rubber (PWA 36029)
P11-014	Alcohol, Isopropyl (PMC 9094)
P18-007	Primer, Silicone (PWA 36086-2)

B. Procedure To Install The Fan Exit (Rear) Liner Segment Assemblies

See Figure 401.

CAUTION: ACOUSTICAL AND NON-ACOUSTICAL LINERS ARE IN SETS. BUT THE LINER THAT IS AT 6 O'CLOCK IS A NON-ACOUSTICAL LINER.

(1) Install the liner as follows.

CAUTION: BE VERY CAREFUL WHEN YOU REMOVE OR INSTALL A LINER SEGMENT. THE WASHERS THAT ARE ATTACHED TO THE FRONT LINER BRACKET CAN BECOME DISCONNECTED FROM THE BRACKET. ALSO, IF THE EDGE OF THE LINER SEGMENT HITS SOMETHING, IT CAN DELAMINATE.

(a) Attach the liners to the cases with screws/bolts, threads lubricated with Engine Oil (P03-001).

Tighten the screws/bolts with your hand. See Figure 402.

NOTE: Screws are (Pre SB PW4ENG 72−107). Bolts are (Post SB PW4ENG 72−107).

The liner that is at 6 o'clock does not use screws/bolts at the leading edge.

(b) (Reference 1013) Torque all the screws/bolts (fasteners) to 36 − 40 lb−in. (4.067 − 4.519 N.m) in the order that follows:

1 Front fasteners.

2 Rear fasteners.

3 Fasteners adjacent to the intermediate case struts.

(c) Visually examine each fastener to make sure that it is correctly installed and touches the washer. If the fastener does not touch the washer, remove it, apply new lubricant and install it again.

NOTE: It is not necessary for the fastener to be symmetrically installed in the washer recess.

Following the initial installation of the liner segments, a relaxation of the fastener torque can occur. Any subsequent check of the fastener torque that shows a value of 15 lb−in. (1.695 N.m) or more is acceptable. If the 15 lb−in. (1.695 N.m) minimum torque value is not met, remove, lubricate and install again the fastener.

(2) For engines with the acoustical fan exit liner segment assemblies (inner rear), use one of the methods that follow to fill the screw holes in the liners. See Figure 402.

NOTE: The liner at 6 o'clock is a non−acoustical liner.

(a) First method:

1 Clean the screw heads and holes with Alcohol (P11−014).

2 Cover the screw heads only with Sealant (P09−029).

3 Fill the outer part of the holes and an area approximately 0.125 inch (3.175 mm) larger than the hole with Sealant (P09−014).

(b) Second method:

1 Cover the screw heads with Tape (P05−231), film side up.

2 Clean the holes with Alcohol (P11−014).

3 Fill the outer part of the holes and an area approximately 0.125 inch (3.175 mm) larger than the hole with Sealant (P09−014).

(c) Third method:

1 Cover the screw heads with Bonding Preventative (P05−137). Cure at 400°F (204.4°C) for one hour.

2 Clean the holes with Alcohol (P11−014).

3 Fill the outer part of the holes and an area approximately 0.125 inch (3.175 mm) larger than the hole with Sealant (P09−014).

(d) Fourth method:

1 Fill the screw holes with AMS 7267 or AMS 7276 packing material.

2 Clean the packing material and holes with Alcohol (P11−014).

3 Fill the outer part of the holes and an area approximately 0.125 inch (3.175 mm) larger than the hole with Sealant (P09−014).

(3) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Apply sealant to the empty spaces between the front liners and the rear liners as follows. See Figure 403.

(a) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Clean the surfaces the sealant will touch. Use PWA 83−D2.

(b) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Apply Sealant (P09−027) to the empty spaces. The surface of the sealant must be smooth and continuous.

(c) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Cure the sealant for eight hours, minimum, before you touch the parts.

(4) If the inner (bifurcation) fairing is already installed, apply sealant to the mating edges of the 11 and 1 o'clock liners and the inner (bifurcation) fairing, as follows (Area AL). See Figure 404.

(a) Clean the areas the sealant will touch. Use a piece of clean Cheesecloth (P05−038) that is moist with Alcohol (P11−014).

(b) Apply Primer (P18−007) to all cleaned surfaces.

1 It is necessary to apply the primer in less than two hours after you cleaned the area.

2 The primer must cure in air that is at ambient temperature for two hours, minimum. The air must have a relative humidity of 25 percent, minimum.

(c) Apply Sealant (P09−019) to the applicable areas.

1 It is necessary to apply the sealant from 2 − 24 hours after you applied the primer.

2 Use a hot air gun at 175° − 225°F (79.° − 107.°C) for 5 − 7 minutes to dry the sealant.

3 After the hot air gun, cure the sealant in air that has a relative humidity of 25 percent, minimum, for eight hours, minimum, before you touch the parts.

ENGINE GENERAL - FAN CASE - INSTALLATION-17

Task 72-00-33-440-002:

1. Install A Fan Exit Liner Seal

A. Equipment and Materials

Consumable Materials:

Item No.	Designation
P05-038	Cheesecloth, Unsized
P09-014	Sealant, Silicone Rubber (PWA 36003)
P11-014	Alcohol, Isopropyl (PMC 9094)

Repair Details:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIGURE	ITEM
Seal	AR	72-33-00	9	325
Seal	AR	72-33-00	9	326
Seal	AR	72-33-00	9	327

B. Procedure

See Figure 401.

(1) Clean the surfaces of the inner fan exit case assembly where you will bond the seals. Use a piece of clean Cheesecloth (P05-038) that is moist with Isopropyl Alcohol (P11-014). Dry the surfaces fully in air that is at room temperature. There must be no solvent on the case when you apply the sealant.

(2) Clean the bonding surface of the seals. Use a non-metallic piece of cloth or paper that has grit in it. The cloth or paper must be free of contaminants. Remove particles of abrasive with a vacuum or use another method which keeps the surface free of contaminants.

(3) Bond the small end seals to the inner fan exit case assembly. Use Sealant (P09-014).

(4) Cut the center seal to Length ET for each seal location. See Figure 401.

(5) Bond the center seals to the inner fan exit case assembly and to the end seals. Use Sealant (P09-014).

(6) Apply Sealant (P09−014) to the ends of the seal ends to fill any empty spaces.

(7) The surface of sealant must be smooth and continuous.

(8) Cure the sealant in air that is at room temperature for eight hours, minimum.

ENGINE GENERAL - FAN CASE - INSTALLATION-20

Task 72-00-33-420-020:

1. Install The Flange C Brackets And Hardware

A. Equipment And Materials Necessary

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

B. Procedure

(1) Install Flange C hardware as follows. See Figure 401.

(2) Install the Flange C bolts, threads lubricated with Engine Oil P03-001, washers, brackets, and nuts.

(3) Torque Flange C bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m). Torque bolts securing guides to intermediate case to 36 - 40 lb-in. (4.067 - 4.519 N.m) if equipped.

NOTE: FOR THESE MODELS: 4152, 4156A, 4158
For engines with the data plate bracket attached to Flange C at boltholes 41 and 42 (Pre SB PW4ENG 72-140) or boltholes 38 and 39 (Post SB PW4ENG 72-140), omit washers at the bracket location.

NOTE: FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
For engines with the data plate bracket attached to Flange C at boltholes 38 and 39, omit the washers at the bracket location.

(4) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Remove any tags or markings on the brackets or flange.

(5) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Examine the assembly for foreign objects, damage, and correct assembly.

ENGINE GENERAL - FAN CASE - INSPECTION/CHECK-01

Task 72-00-33-990-001:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B or C located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.

C. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits

(1) Limits applicable to any combination of new or used parts.

(a) This column provides the acceptable (minimum − maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.

(b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.

(c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (13.131)	(−)	0.512 (13.005)	=	.005 (0.126)
0.527 (13.385)	(−)	0.508 (12.903)	=	.019 (0.482)

EXAMPLE 2

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3. These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

F. Fits And Clearances

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max

ENGINE GENERAL - FAN CASE - INSPECTION/CHECK-02

Task 72-00-33-210-001:

1. Inspect Electronic Engine Control (EEC) Water Traps

A. Equipment And Materials Necessary

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P11-014	Alcohol, Isopropyl (PMC 9094)

B. Procedure
See Figure 801.

CAUTION: USE OF LUBRICANTS ON EEC SENSING TUBES, ADAPTERS, OR PACKINGS COULD RESULT IN CONTAMINATION OF EEC.

(1) Inspect the PB (burner pressure) water trap.

(a) Remove the lockwire and remove the water trap from EEC, PB manifold.

(b) Empty the water trap and inspect the bleed hole to make sure it is clear.

(c) Clean the condensation trap by one of the methods that follow:

NOTE: Ultrasonic cleaning has proven to be effective in throughly cleaning water traps.

1 Preferred Method of Cleaning:

a Clean the hole in the condensation trap with a 0.010 - 0.015 inch (0.254 - 0.381 mm) diameter steel wire.

b Clean the side−walls of the trap with a rough cylindrical bristle brush (with strong fibers such as natural, nylon, polyester or tampico) that will not scratch the trap interior.

NOTE: Do not use ferrous material type brushes. Use a stainless steel brush only.

c Ultrasonic clean the condensation trap by SPOP 91, Section 70−21−00 of the Standard Practices Manual, PN 585005.

d After you have completed the ultrasonic cleaning, rinse the trap with water and blow compressed air through the trap to clean the condensation trap of any unwanted material. You can use a 0.010 − 0.015 inch (0.254 − 0.381 mm) diameter steel wire to remove any obstruction or blockage.

e Do a visual inspection of the trap to make sure there are no obstructions or blockages. A 10X magnifying glass with a light can be used to help in the inspection. If you can see through the hole, the trap can be considered clean and can be reinstalled.

f If any obstruction or blockage is seen, it is permitted to manually insert a 0.010 − 0.015 inch (0.254 − 0.381 mm) diameter drill bit through the hole to remove any blockage. It is permitted to manually insert the drill into the hole without making the hole oversize.

g If cleaning does not remove the unwanted material or blockage, replace the condensation trap.

2 Alternate Method of Cleaning

a Clean the hole in the condensation trap with a 0.010 − 0.015 inch (0.254 − 0.381 mm) diameter steel wire.

b Clean the side−walls of the trap with a rough cylindrical bristle brush (with strong fibers such as natural, nylon, polyester or tampico) that will not scratch the trap interior.

NOTE: Do not use ferrous material type brushes. Use a stainless steel brush only.

c Clean the bottom of the trap with a stainless steel brush (such as a Dremmel #532) and Isopropyl Alcohol P11−014 or equivalent. After you clean the bottom of the trap, check the inside of the trap and the bleed hole to make sure it is free of loose material, fluid, soot or scale deposits. A 0.010 − 0.015 inch (0.254 − 0.381 mm) diameter steel wire or drill bit must be able to easily pass through the bleed hole without collecting or dislodging debris. Do this procedure again, as necessary.

d Rinse the trap with water and blow compressed air through the trap to clean the condensation trap of any unwanted material.

e Do a visual inspection of the trap to make sure there are no obstructions or blockages. A 10X magnifying glass with a light can be used to help in the inspection. If you can see through the hole, the trap can be considered clean and can be reinstalled.

f If cleaning does not remove the unwanted material or blockage, replace the condensation trap.

(d) For basic engines install a water trap to the tee on the manifold. Torque the water trap to 270 − 300 lb−in. (30.506 − 33.895 N.m). Safety the nut with Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292. See Figure 801 (Sheet 1).

(e) For engines with commonality parts between Airbus and McDonnell Douglas, install the water trap to the tee on the manifold. Torque the trap to 320 − 350 lb−in. (36.155 − 39.545 N.m). Safety the trap assembly with Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292. See Figure 801 (Sheet 2).

(2) Inspect PT4.95 exhaust gas pressure water trap.

(a) Remove the lockwire and the cap and drain the water.

(b) Install the cap to the tee. Torque the cap to 270 − 300 lb−in. (30.506 − 33.895 N.m). Safety the cap with Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(3) Inspect the PAMB (ambient pressure) water trap.

(a) Remove the lockwire and the cap and drain the water.

(b) Install the cap to the tee. Torque the cap to 270 − 300 lb−in. (30.506 − 33.895 N.m). Safety the cap with Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(4) Inspect the PT2 inlet pressure water trap.

(a) Remove the lockwire and the cap and drain the water.

(b) Install the cap to the tee. Torque the cap to 270 − 300 lb−in. (30.506 − 33.895 N.m). Safety the cap with Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

A. Equipment And Materials Required − None

B. Procedure

(1) Inspect the intercompressor (2.5) bleed valve actuator for leakage. Replace the actuator or the adapter packings if leaks are found.

(2) Inspect the 2.5 bleed valve screen. See Figure 801.

(a) Inspect the plastic bleed screen for cracks, missing pieces and distortion.

(b) Cracks through two adjacent webs in any direction or location are acceptable.

(c) Cracks are limited to three locations. The cracks must be separated by two or more webs which are not cracked.

(d) Missing pieces are not permitted.

(e) Unlimited distortion is permitted as follows:

1 Edge gaps caused by the distortion are no wider than the width of the screen mesh, 0.200 inch (5.080 mm).

(f) Replace screens that are more than the acceptable limits. See 72−33−00, Assembly−01 Task 72−33−00−400−001.

ENGINE GENERAL − FAN CASE − INSPECTION/CHECK−04

Task 72−00−33−210−003:

1. Examine The Sealant At The Bifurcation Fairing

A. Equipment And Materials − None

B. Procedure

(1) Examine the sealant at the bifurcation fairing. Refer
R to Figure 801, Figure 802, and Table 801.

NOTE: The access cover is (Post SB PW4ENG 72−161).

ENGINE GENERAL − FAN CASE − INSPECTION/CHECK−04

Inspect	Serviceable Limits	Repairable Limits	Repair
Fairings at 12 o'clock for damaged or loose sealant	Not permitted	No limit	−01

NOTE: The repairs and their task numbers are given below.

ENGINE GENERAL - FAN CASE - INSPECTION/CHECK-05

Task 72-00-33-210-004:

1. Do A Check Of The Clearance Between The Trailing Edges Of The Fan Exit (Front) Liner Segment Assemblies And The (Rear) Liner Segment Assemblies

NOTE: This check is necessary if you replace a (front) liner in 72-33-02, Assembly-01 (Task 72-33-02-440-001), 72-00-33, Installation-01 (Task 72-00-33-420-001) or 72-00-33, Installation-14 (Task 72-00-33-450-001).

This check is not necessary if the (rear) liner is an acoustical (hush-kit) liner.

A. Equipment and Materials

Standard Tools:
No. 10 Torq-set Drive

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-038	Cheesecloth, Unsized
P09-014	Sealant, Silicone Rubber (PWA 36003)
P09-027	Sealant, Silicone Rubber (PWA 36003-2)
P11-014	Alcohol, Isopropyl (PMC 9094)

B. Procedure

(1) (References 751 and 1012) Do a check of the clearance between the trailing edges of all the fan exit (front) liner segment assemblies and the front of the fan exit (rear) liner segment assemblies. See Figure 401.

(2) (Reference 1012) Do a check of the clearance between the front and rear areas of the fan exit inner (bifurcation) fairing at Flange D. See Figure 401.

NOTE: Pre SB PW4ENG 72-370 inner fairings are one-piece. Post SB PW4ENG 72-370 inner fairings are two-piece.

(3) Where the clearance is not correct, attach washers to the boltholes at the trailing edges of the (front) liners as follows. See Table 401 for washer thicknesses.

Table 401

(a) Remove the screws from the trailing edges of the (front) liners and/or fairing at Flange D.

(b) Clean the washers and the area around the boltholes. Use a clean piece of Cheesecloth (P05−038) that is moist with Alcohol (P11−014). Dry the surfaces fully in air that is at room temperature. There must be no alcohol on the parts when sealant is applied.

(c) Put the washers in the correct position on the liner. Install screws if necessary.

(d) Bond the washers to the (front) liners with a fillet of Sealant (P09−014) or (P09−027) all around. Cure the sealant in air that is at room temperature for four hours before you touch it.

NOTE: It is permitted to have a very small quantity of sealant between the washer and the liner.

(e) Attach the trailing edges of the liners with screws, threads lubricated with Engine Oil (P03−001). Refer to Table 402 for screw lengths. Torque the screws to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(f) Attach the edge of the inner fairing at Flange D with screws, threads lubricated with Engine Oil (P03−001). Refer to Table 402 for screw lengths. Tighten the screws against the fairing.

Screw PN	Screw Length	Washer Thickness	Quantity of Screws
593111	0.495 - 0.505	0.000 - 0.015	0 - 45 As Necessary

Task 72-00-33-210-010:

1. Fan Case Module Assembly Visual Inspection

A. Equipment And Materials Necessary - None

B. General Inspection Limits

NOTE: All applicable Airworthiness Directives (AD's) must be complied with and these directives takes precedence over all inspections or repairs given in this module inspection.

(1) This inspection does not permit time since overhaul to be set to zero.

(2) These procedures give instructions for the visual inspection of the fan case module assembly after removal from the engine. Do these procedures before you do the preservation, packing or module installation procedure. This procedure is to find those easy to see types of damage, which can make it necessary to do more disassembly, inspection or repair. For the general visual inspection instructions, refer to Section 70-31-00 in the Standard Practices Manual, PN 585005.

(3) The inspection table in this section is applicable to the fan case modules with some, none or all of the components installed. You do not have to disassemble the module assembly to do this inspection. You can choose to apply individual limits to those areas that are visible at all stages of disassembly. If a condition shows that there can be damage that you cannot see, remove a component to fully examine the damaged area. Use the applicable procedures in this manual to remove the component and do an inspection by step (4).

(4) Remove all the components that you find not serviceable at the modular level. Send the applicable components for more inspection and repair at the component level maintenance. Refer to Section 72-33-00 in the PW4000 Series CIR, PN 51A357. Component that you remove from the fan case module, will need a Cleaning, Inspection and Repair Manual component level inspection/check.

(5) Unless given differently, non-toleranced the areas given in this section are to corners, points of tangency between surfaces or at the points opposite to one of these locations.

ENGINE GENERAL − FAN CASE − INSPECTION/CHECK−10

C. Procedure

(1) Visually examine the fan rotor duct segment assemblies for surface damage and wear. See Table 801 and Figure 801.

NOTE: The first configuration of duct segments has continuous grooves. The alternate configuration of duct segments has interrupted grooves.

(2) Visually examine the ID gaspath surface of the fan case and fan exit case between the fan rubstrip and fan exit guide vanes for surface damage. See Table 802 and Figure 802.

(3) Visually examine the external surfaces on the fan case and fan exit case and vane assembly for surface damage. See Table 803 and Figure 803.

(4) Visually examine the fan exit guide vane airfoils and ID and OD bases for surface damage. See Table 804 and Figure 804.

(5) Visually examine the fan exit inner case and 2.5 bleed duct assembly for wear and surface damage. See Table 805 and Figure 805.

(6) Visually examine the fan exit liner assemblies and bleed screens for damage. See Table 806 and Figure 806.

R (7) Visually examine the fan exit inner case rear side fire
R ablative blanket assembly or coat for missing or
R damaged areas, tears or punctures. See Table 807 and
R Figure 807.

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Duct segments for: (Figure 801, Sheet 2) Missing rib sections			
Total for one rib, each segment	3.000 inch (76.200 mm) maximum circumferential length	6.000 inch (152.400 mm) maximum circumferential length	Refer to Section 72-33-01, Repair-03, Repair-07, Repair-08 and Repair-09 in the PW4000 Series CIR, PN 51A357.
Total for one rib, all segments	10.000 inch (254.000 mm) maximum circumferential length	15.000 inch (381.000 mm) maximum circumferential length	Refer to Section 72-33-01, Repair-03, Repair-07, Repair-08 and Repair-09 in the PW4000 Series CIR, PN 51A357.
Separation from an area on an adjacent rib where there is no rib	6.000 inches (152.400 mm) minimum	12.000 inches (304.800 mm) minimum	Refer to Section 72-33-01, Repair-03, Repair-07, Repair-08 and Repair-09 in the PW4000 Series CIR, PN 51A357.
Cracks			

Fan (Rubstrip) Duct Segment Inspection
Table 801

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Crack width	0.015 inch (0.381 mm) maximum	0.125 inch (3.175 mm) maximum	Refer to Section 72−33−01, Repair−06, Repair−08 and Repair−09 in the PW4000 Series CIR, PN 51A357.
Crack spacing	4.000 inches (101.600 mm) minimum separation		Refer to Section 72−33−01, Repair−06, Repair−08 and Repair−09 in the PW4000 Series CIR, PN 51A357.
Circumferential crack length	4.000 inches (101.600 mm) maximum length	6.000 inches (152.400 mm) maximum	Refer to Section 72−33−01, Repair−06, Repair−08 and Repair−09 in the PW4000 Series CIR, PN 51A357.
Axial crack length	4.000 inches (101.600 mm) maximum length	Replace the segment	Refer to Section 72−33−01, Repair−08 and Repair−09 in the PW4000 Series CIR, PN 51A357.
	0.250 inch (6.350 mm) minimum distance from the axial edge of the panel		

Fan (Rubstrip) Duct Segment Inspection
Table 801 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Holes duct segment surface (Figure 801, Sheet 2)			
Dimensions at widest point	0.125 inch (3.175 mm) maximum	6.000 inch (152.400 mm) maximum circumferential length of the repaired area, each segment. 12.000 inch (304.800 mm) minimum separation between the incidents. 15.000 inch (381.000 mm) maximum circumferential length, all segments.	Refer to Section 72-33-01, Repair-05, Repair-08 and Repair-09 in the PW4000 Series CIR, PN 51A357.
Depth	0.125 inch (3.175 mm) maximum	A maximum of full thickness of the duct segment	
Disbond			
NOTE: Examine the duct segments to know if they are bonded to the case by lightly tapping the rubstrip while you listen for a difference in sound. The machined hollow cavities can cause small differences in sound.			
Fully unbonded segment	Not permitted	Replace the fan duct segments	Refer to Section 72-33-01, Repair-08 and Repair-09 in the PW4000 Series CIR, PN 51A357.

Fan (Rubstrip) Duct Segment Inspection
Table 801 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Not fully unbonded segment	See Figure 801, Sheet 2	Replace the fan duct segments with unbonded areas more than the serviceable limits.	Refer to Section 72-33-01, Repair-08 and Repair-09 in the PW4000 Series CIR, PN 51A357.
Leading edge retaining pins for looseness or missing	Not permitted	Replace the retaining pins.	Refer to Section 72-33-01, Repair-08 and Repair-09 in the PW4000 Series CIR, PN 51A357.

Examine the rib wear with PWA 29156 Gage by the procedure that follows:

(a) Take a measurement at each of the eight positions in the third groove from the front (large outer diameter) of the fan case. See Figure 801 (Sheet 1).

(b) Calculate the average of the readings for the three positions in a group as noted below. Do the same for the three positions that are in each of the other groups (Group A thru Group F).

(C) Locations of gage readings.

Group	Position
A	7, 8, 1
B	8, 1, 2
C	1, 2, 3
D	3, 4, 5
E	4, 5, 6
F	5, 6, 7

Fan (Rubstrip) Duct Segment Inspection
Table 801 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Rib wear	0.140 inch (3.556 mm) minimum overall average depth Group A − Group F	Duct segments worn to values below the serviceable limits must be repaired.	Refer to Section 72−33−01, Repair−03, Repair−07, Repair−08 and Repair−09 in the PW4000 Series CIR, PN 51A357.
	No individual group value below 0.117 inch (2.972 mm).		
	No more than two group averages below 0.140 inch (3.556 mm).		

Fan (Rubstrip) Duct Segment Inspection
Table 801 (Continued)

R	Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
R	Case inner diameter surface for: (Figure 802)			
R	Cracks	Not permitted		Remove from service.
R	Rear retention lip for surface damage	Not permitted	Rubstrip rear retention lip damage can be blended to 0.130 inch (3.302 mm) maximum axially by 1.500 inch (38.100 mm) maximum circumferentially.	Blend to remove the damage. Refer to Section 70-45-00, SPOP 533 in the Standard Practices Manual, PN 585005.
R	1 Nicks, dents and other surface damage in the fan case	Not permitted	See the repair.	Refer to Section 72-33-01 Repair-02 in the PW4000 Series CIR, PN 51A357.
R	2 Superficial surface damage in the fan exit case	Not Permitted	See the repair.	Refer to Section 72-33-03, Repair-02 in the PW4000 Series CIR, PN 51A357.

Gaspath Surface Inspection
Table 802

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
External surfaces other than flanges: (Figure 803, Sheet 1)			
Cracks	Not Permitted		Replace from service.
1 Nicks, (sharp) dents, corrosion pits, other surface on the fan exit damage	Not Permitted	See the repair.	Refer to Section 72-33-01, Repair-02 in the PW4000 Series CIR, PN 51A357.
2 Superficial surface damage on the fan exit case	Not Permitted	See the repair.	Refer to Section 72-33-03, Repair-02 in the PW4000 Series CIR, PN 51A357.
		Corrosion adjacent to the fan exit guide vane outer diameter bolt holes 0.020 inch (0.508 mm) maximum depth.	Can be wire brush cleaned and anodized

NOTE: Examine the damage in the case by local fluorescent penetrant inspection to make sure that there are no cracks. Refer to Section 70-33-00 SPOP 70 (normal sensitivity) in the Standard Practices Manual, PN 585005.

External Surface Inspection
Table 803

R	1 2.5 bleed valve duct screen for: (Figure 806, Sheet 1 and Figure 806, Sheet 2)			
R	Missing pieces	Not permitted	Not repairable, replace the screen.	Refer to Section 72-33-00 Assembly-01, Figure 1001 in the PW4152 Series Engine Manual, PN 50A443.
R	Cracks	Cracks in two adjacent webs, three locations maximum. Two web minimum separation.	Not repairable, replace the screens that are more than the permitted limits.	Refer to Section 72-33-00 Assembly-01, Figure 1001 in the PW4152 Series Engine Manual, PN 50A443.
R	Distortion	0.200 inch maximum clearance between screen and the case that is caused by distortion.	Not repairable, replace the screens that are more than the permitted limits.	Refer to Section 72-33-00 Assembly-01, Figure 1001 in the PW4152 Series Engine Manual, PN 50A443.
R	2 Fan exit liner segment assembly for: (Figure 806, Sheet 1 and Figure 806, Sheet 3)			

Fan Exit Liners And Bleed Screens Inspection
Table 806

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Missing, or loose washers, nut plates, rivets or splice plates	Not permitted	Replace the missing hardware.	Refer to Section 72-33-18, Repair-03, Repair-04 and Repair-05 in the PW4000 Series CIR, PN 51A357.
Surface damage on washers, nut plates, rivets or splice plates	0.005 inch (0.127 mm) maximum depth is permitted with no raised material or sharp edges	Replace the missing hardware.	Refer to Section 72-33-18, Repair-03, Repair-04 and Repair-05 in the PW4000 Series CIR, PN 51A357.
Nicks, dents or gouges	0.030 inch (0.762 mm) maximum depth. 1.000 inch (25.400 mm) maximum width or length. 2.000 inch (50.800 mm) minimum separation. Five damaged areas maximum for each segment.	Not repairable, replace segment that is more than the permitted limits.	Refer to Section 72-00-33, Installation-01 in the PW4152 Series Engine Manual, PN 50A443.
Cracks	1.000 inch (25.400 mm) maximum length. 0.500 inch (12.700 mm) minimum distance from the center of the screw hole.	Not repairable, replace the segment that is more than the permitted limits.	Refer to Section 72-00-33, Installation-01 in the PW4152 Series Engine Manual, PN 50A443.

Fan Exit Liners And Bleed Screens Inspection
Table 806 (Continued)

ENGINE GENERAL - FAN CASE - INSPECTION/CHECK-10

R	Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
R	Areas of broken or fuzzy stray fibers	0.030 inch (0.762 mm) maximum depth. 1.000 inch (25.400 mm) maximum diameter. 2.000 inch (50.800 mm) minimum separation.	Not repairable, replace segment that is more than the permitted limits.	Refer to Section 72-00-33, Installation-01 in the PW4152 Series Engine Manual, PN 50A443.
R	Punctures or holes	Not permitted	1.000 inch (25.400 mm) maximum diameter. 1.000 inch (25.400 mm) minimum separation. 1.000 inch (25.400 mm) minimum edge distance. 25 percent maximum repairable surface area.	Refer to Section 72-33-18, Repair-02 in the PW4000 Series CIR, PN 51A357.
R	Erosion at the leading edge (dull or rough surface finish, fibers seen)	0.020 inch (0.508 mm) maximum depth. 0.750 inch (19.050 mm) maximum width or length. No cracks or delamination is permitted. 2.000 inch (50.800 mm) minimum damage separation.	Not repairable, replace the segment that is more than the permitted limits.	Refer to Section 72-00-33, Installation-01 in the PW4152 Series Engine Manual, PN 50A443.

ENGINE GENERAL - FAN CASE - REPAIR-01

Task 72-00-33-300-001-001:

1. Repair The Sealant Around The Bifurcation Fairing (Pre SB PW4ENG 72-370)

A. Equipment And Materials

Consumable Materials:

Item No.	Designation
P09-019	Sealant, Flame Resistant Silicone Rubber (PWA 36751-1)
P09-027	Sealant, Silicone Rubber (PWA 36003-2)
P18-007	Primer, Silicone (PWA 36086-2)

B. Procedure

Subtask 72-00-33-350-051:

CAUTION: DO NOT DAMAGE THE PARENT METAL WHEN YOU REMOVE THE SEALANT.

(1) Mechanically remove any damaged or unbonded sealant from areas shown in Figure 901.

(2) If necessary, apply sealant to Area AL.

(a) Clean the areas the sealant will touch. Use PWA 83-D4, but do not use trichlorotrifluoroethane.

(b) Apply Primer P18-007 to all cleaned surfaces.

1 It is necessary to apply the primer in less than two hours after you cleaned the area.

2 The primer must cure in air at ambient temperature for two hours, minimum. The air must have a relative humidity of 25 percent, minimum.

(c) Apply Sealant P09-019.

1 It is necessary to apply the sealant from 2 - 24 hours after you applied the primer.

2 Use a hot air gun at 175° - 225°F (79.° - 107.°C) for 5 - 7 minutes to dry the sealant.

3 After the hot air gun, cure the sealant in air that has a relative humidity of 25 percent, minimum, for eight hours, minimum, before you touch the parts.

(3) If necessary, apply sealant to Area AM:

(a) Clean the areas the sealant will touch. Use PWA 83−D4, but do not use trichlorotrifluoroethane.

(b) Apply Sealant P09−027. Cure the sealant in air that has a relative humidity of 25 percent, minimum, for eight hours, minimum, before you touch the parts.

Task 72−00−33−300−001−002:

2. Repair The Sealant Around The Bifurcation Fairing (Post SB PW4ENG 72−370)

A. Equipment and Materials

Consumable Materials:

Item No.	Designation
P09−019	Sealant, Flame Resistant Silicone Rubber (PWA 36751−1)
P09−027	Sealant, Silicone Rubber (PWA 36003−2)
P18−007	Primer, Silicone (PWA 36086−2)

B. Procedure
See Figure 902.

Subtask 72−00−33−350−052:

(1) Mechanically remove any damaged or unbonded sealant from areas shown in the referenced figure.

(2) If necessary, apply sealant at Area AM as follows:

(a) Before you bond the parts, clean them. Use PWA 83−D4 (Task 70−48−00−360−001), but do not use trichlorotrifluoroethane.

(b) Apply Sealant P09−027 to the clearances between the parts.

2. Apply The Sealant Even With, To 0.010 Inch (0.254 mm) Below, All Around The Access Cover, Two Places

Key to Figure 901 (Sheet 1)

(c) Cure the parts in air that is at room temperature, has a relative humidity of 25 percent, minimum, for eight hours, before you touch the parts.

(3) If necessary, apply sealant at Area AL as follows:

(a) Clean all areas. Use PWA 83−D4 (Task 70−48−00−360−001), but do not use trichlorotrifluoroethane.

(b) Prime all the surfaces you cleaned. Use Primer P18−007. You must apply the primer in less than two hours after you cleaned the parts. Cure the primer for two hours, minimum, in air that is at ambient temperature, and has a relative humidity of 25 percent, minimum, before you touch the parts.

(c) Fill all cleaned and primed areas with Sealant P09−027. You must apply the sealant to the primed areas in 2 − 24 hours. Cure the sealant with a hot air gun at 175° − 200°F (79.° − 93.°C) for 5 − 7 minutes before you air cure the sealant. After you use the hot air gun, air cure the sealant for eight hours minimum in ambient air that has a relative humidity of 25 percent, minimum, before you touch the parts.

ENGINE GENERAL - FAN CASE - REPAIR-02

Task 72-00-33-300-002:

1. Install Boltholes In The Replacement Access Covers

A. Prerequisites

(1) Remove the cover plate and the damaged access cover from the 12 o'clock strut.

NOTE: Do not remove the other fairings from the 12 o'clock strut.

B. Equipment and Materials

Consumable Materials:

Item No.	Designation
P05-152	Agent, Wetting (PMC 1610)
P08-002	Resin, Liquid Epoxy (PWA 421-2)
P08-012	Agent, Epoxy Resin Curing (PWA 422)
P08-016	Epoxy, Adhesive Paste (PWA 457)

Repair Details:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Cover	1	72-33-00/9/560B
Cover	1	72-33-00/9/570B
Washer	2	72-33-00/9/565

C. Procedure
See Figure 901.

Subtask 72-00-33-350-053:

(1) Find the positions of the new holes as follows.

(a) Attach a replacement access cover(s) and a cover plate to the inner fairing with bolts at the positions shown in the referenced figure.

(b) Mark the centerlines of all the hole diameters.

(c) Remove the previously installed workbolts.

(d) Remove the access cover and cover plate.

Subtask 72−00−33−350−054:

(2) Install the boltholes at the positions marked.

(3) Apply sealant to the machined surfaces of the cover(s) as follows.

- (a) Wash the machined surfaces of the fairings and cover(s) with a solution of water and Wetting Agent P05−152.
- (b) Fully rinse the machined surfaces with clean water.
- (c) Dry the machined surfaces fully in air that is at room temperature.
- (d) Mix together, in a 4:1 proportion, Resin P08−002 and Curing Agent P08−012. Apply the epoxy mixture to the machined surfaces. Cure the epoxy mixture at 175°F (79.4°C) for one hour, minimum.

(4) Bond washers to the boltholes.

- (a) Clean the bond area of the boltholes. Use PWA 83−D2 (Task 70−48−00−360−001).
- (b) Clean the bond area of the washers with PWA 83−D4 (Task 70−48−00−360−001), but use isopropyl alcohol.
- (c) Apply a constant layer of Epoxy P08−016 to each bond area of the access cover(s) within 30 minutes after you cleaned it.
- (d) Bond the washers to the access cover(s).
- (e) Cure the epoxy at room temperature for two hours, minimum.

ENGINE GENERAL - INTERMEDIATE CASE - REMOVAL-01

Task 72-00-34-020-001:

1. Remove Intermediate Case

NOTE: See Figure 301 for Part/Assembly Removal Procedure Sequence.

A. Prerequisites

(1) For engines not equipped with engine multiplexer unit (PMUX) or the supplemental control unit (SCU), remove electronic engine control (EEC) speed transducer (N1). Refer to 72-00-34, Removal-03 (Task 72-00-34-050-001).

(2) For engines equipped with engine multiplexer unit (PMUX) or the supplemental control unit (SCU), remove electronic engine control (EEC) speed transducer (N1) multiplexer input probe. Refer to 72-00-34, Removal-17 (Task 72-00-34-050-014).

(3) Remove The Main Gearbox. Refer to 72-00-61, Removal-01 (Task 72-00-61-020-001).

(4) Remove The Compressor Inlet Cone. Refer to 72-00-31, Removal-02 (Task 72-00-31-020-001).

(5) Remove All Stage 1 LPC Blade Assemblies. Refer to 72-00-31, Removal-04 (Task 72-00-31-020-002-002).

(6) Remove The LPC/LPT Coupling (With The Front Compressor Drive Turbine Shaft Installed). Refer to 72-00-32, Removal-01 (Task 72-00-32-020-001).

(7) Remove The Low Pressure Compressor (LPC). Refer to 72-00-31, Removal-01 (Task 72-00-31-020-003).

(8) Remove The Turbine Exhaust Case. Refer to 72-00-54, Removal-01 (Task 72-00-54-020-001).

(9) Remove The Low Pressure Turbine (LPT) With Shaft. Refer to 72-00-53, Removal-01 (Task 72-00-53-020-001).

(10) Remove The Fan Case. Refer to 72-00-33, Removal-01 (Task 72-00-33-020-001).

(11) Remove The No. 1 Bearing Support (Front And Rear) Assembly. Refer to 72-00-34, Removal-04 (Task 72-00-34-050-002).

(12) Remove The No. 1 Bearing Vibration Transducer, if applicable. Refer to 72-00-34, Removal-22 (Task 72-00-34-040-001).

(13) Remove The No. 1.5 Bearing Support Assembly. Refer to 72-00-34, Removal-06 (Task 72-00-34-030-001).

(14) Remove The High Pressure Turbine (HPT). Refer to 72-00-52, Removal-01 (Task 72-00-52-020-001).

(15) Remove The Turbine Nozzle. Refer to 72-00-51, Removal-01 (Task 72-00-51-020-001).

(16) Remove No. 3 Bearing Rear (Carbon) Seal Assembly And Rear Seal Seat. Refer to 72-00-41, Removal-03 (Task 72-00-41-020-003).

(17) Disconnect/Remove Harnesses For Removal Of The Intermediate Case. Refer to 72-00-34, Removal-05 (Task 72-00-34-050-003).

(18) Disconnect/Remove External Plumbing For Removal Of The Intermediate Case. Refer to 72-00-34, Removal-02 (Task 72-00-34-020-002).

(19) Trunnion Intermediate Case Through Diffuser And Combustor From Horizontal To Front End Down Position. Refer to 72-00-00, Special Procedures-09 (Task 72-00-00-020-002-A00) or (Task 72-00-00-020-002-B00).

B. Equipment And Materials Necessary

Special Tools:

PWA 28657	Sling
PWA 85064	Fixture, Handling
PWA 85246	Plug, Holding
PWA 76156	Adapter, Lift And Trunnion
PWA 27424	Pin, Aligning (3 Necessary)
PWA 87022	Stand, Build And Storage
PWA 88709	Plug, Holding
PWA 101848	Puller, Jackscrew (6 Necessary)

C. Procedure
See Figure 302.

(1) Thread PWA 85246 Plug onto HPC rear hub at center of diffuser case.

(2) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
(Pre SB PW4ENG 72-562) Thread the PWA 85246 Plug onto the HPC rear hub at the center of the diffuser case.

(3) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
(Post SB PW4ENG 72-562) Thread the PWA 88709 Plug onto the HPC rear shaft at the center of the diffuser case.

(4) Attach two PWA 76156 Adapters to PWA 28657 Sling and attach adapters to trunnion spools of PWA 85064 Fixture.

(5) Loosen knobs in center hub of fixture and using hoist install fixture to rear of diffuser case. Align dowel pin in fixture with hole in case and secure with detail bolts. Tighten center hub knobs.

(6) Remove the workbolts from the 33 bolt circle at the front of the intermediate case at Flange E.

(7) Install a PWA 27424 Aligning Pin in three equally spaced holes in the 33 bolt circle.

(8) Remove the Flange E hardware as follows. Refer to 72-00-34, Removal-20 (Task 72-00-34-020-020).

NOTE: Flange E has two configurations, the UPS configuration has 72 bolts and the other configuration has 74 bolts.

(9) Install jackscrews at No. 2 bearing support location. Install PWA 101848 Jackscrew Plate under variable vane trunnion bosses at 5th stage location (6 places equally spaced).

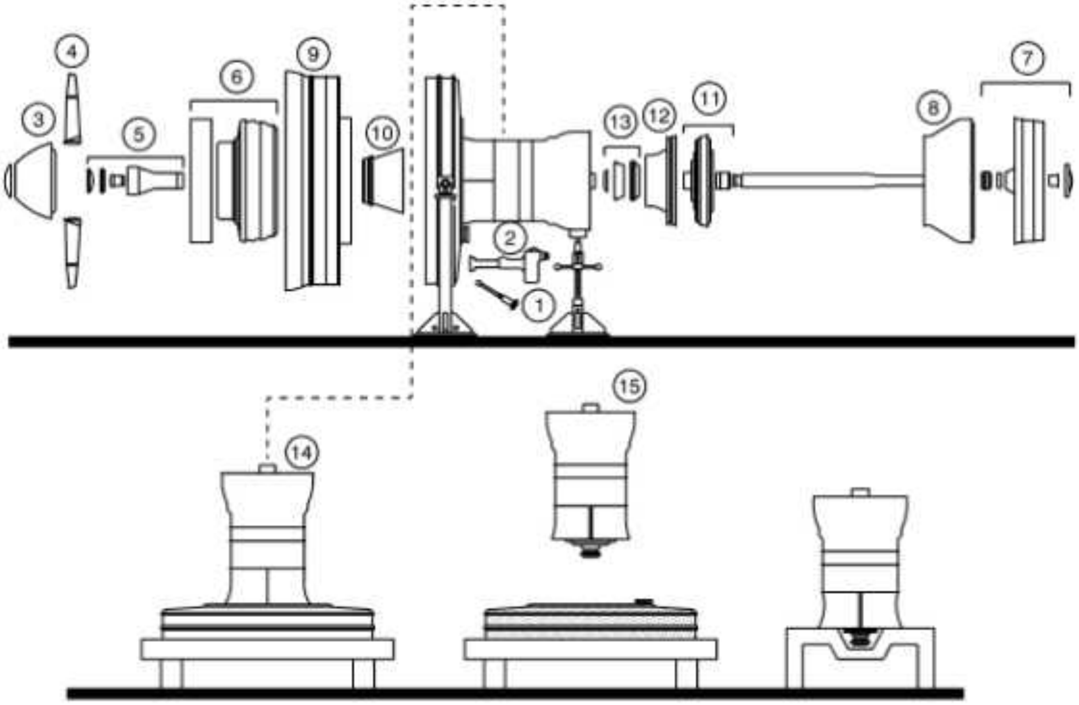
(10) With jackscrews, jacking plates and hoist, separate HPC and diffuser and combustion assembly from intermediate case.

(11) Remove HPC and diffuser and combustion assembly. Discard packing from OD of No. 2 bearing support. Lower the HPC and diffuser and combustion assembly onto PWA 87022 Build Stand. Remove jacking plates from HPC. Remove hoist, sling and adapters.

(12) If equipped, remove packing from intermediate case Flange E.

(13) Remove jackscrews from No. 2 bearing support one at a time and replace with 1/4−28 workbolts.

(14) Remove the three aligning pins.



1. REMOVE ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).
2. REMOVE MAIN GEARBOX.
3. REMOVE COMPRESSOR INLET CONE.
4. REMOVE STAGE 1 LPC BLADE ASSEMBLIES.
5. REMOVE LPC/LPT COUPLING.
6. REMOVE LOW PRESSURE COMPRESSOR (LPC).
7. REMOVE TURBINE EXHAUST CASE.
8. REMOVE LOW PRESSURE TURBINE (LPT).
9. REMOVE FAN CASE.
10. REMOVE NO. 1 BEARING SUPPORT ASSEMBLY.
11. REMOVE HIGH PRESSURE TURBINE (HPT).
12. REMOVE TURBINE NOZZLE.
13. REMOVE NO. 3 BEARING REAR SEAL ASSEMBLY AND REAR SEAL PLATE.
14. TRUNNION INTERMEDIATE THROUGH DIFFUSER CASE TO FRONT END DOWN.
15. REMOVE DIFFUSER AND HIGH PRESSURE COMPRESSOR FROM INTERMEDIATE CASE.

Task 72-00-34-020-002:

1. Remove External Plumbing For Intermediate Case Removal

A. Equipment And Materials Required

Special Tools:

CTE 5070	Cart, Airflow (Optional to CTE 6070)
CTE 6070	Cart, Airflow
PWA 85564	Adapter

B. Procedure
See Figure 301.

(1) For engines not equipped with engine multiplexer unit (PMUX), remove EEC PB tube assembly (AS20) from strut as follows.

(a) Remove lockwire and disconnect tube nut from tube coupling below strut at approximately 12:30 o'clock position.

(b) Remove bolt, nut and clamp securing tube to guide at top of intermediate case.

(c) Remove tube from grommets inside strut and install protective closures.

(2) For engines equipped with engine multiplexing unit (PMUX) or engines with common parts configuration Airbus/McDonnell Douglas, remove the EEC PT2.5 sensing and PB tube assembly (AS20/29) from the strut as follows.

(a) Remove the lockwire and disconnect both tube nuts from the tube couplings below the strut at approximately the 12:30 o'clock position.

(b) Remove the two bolts and clamps that attach the sensing tubes to a bracket on the solenoid switch at the 12:30 o'clock position below the strut.

(c) Remove the bolt and nut that attach the (AS29) tube to a bracket on Flange C at the 12:30 o'clock position. See View T.

NOTE: The bolt that attaches the clamp on tubes (AS20/29) to the guide on the intermediate case is removed with the W1 harness. See View S.

(d) Remove the grommet that attaches the (AS20/29) tube assemblies to the top inside of strut.

(e) Remove the assemblies from grommets inside the strut. Install protection covers to the tube assemblies.

(3) For engines equipped with common parts configuration Airbus/McDonnell Douglas, remove the EEC PT4.95 tube assembly (AS04) from the strut as follows.

(a) Remove the lockwire and disconnect the tube nut from the tube coupling at approximately the 11:30 o'clock position.

(b) Remove the bolt that attaches a tube clamp (welded) to a support assembly on the intermediate case assembly guide position. See View R.

(c) Remove the tube from the grommets inside the strut and install protection covers.

(4) For basic engines, remove EEC PT4.95 tube assembly (AS04) from strut as follows.

(a) Remove lockwire and disconnect tube nut from tube coupling at approximately 11:30 o'clock position.

(b) Remove bolt, nut, and clamp securing tube to guide at top of intermediate case.

(c) Remove bolt and clamp securing tube to top inside of strut.

(d) Remove tube from grommets inside strut and install protective closures.

(5) For engines with the PT4.95 maintenance break at Flange K (Post SB PW4ENG 73−106), remove the EEC PT4.95 tube assembly (AS41) as follows.

   (a) Remove lockwire and disconnect the tube at approximately 11:00 o'clock position adjacent to Flange K.

   (b) Remove the bolts, nuts, and clamps that attach the tube.

   (c) Remove the tube and install the protection covers.

(6) Remove air shutoff valve signal tube assembly (AA18) and HPC air valve signal tube assembly (AA06) as follows.

   (a) Remove lockwire and disconnect tubes from air filters above left side 2.9 bleed valve forward of Flange J.

   (b) Remove lockwire and disconnect tubes from air valve solenoid at approximately 10 o'clock position near Flange E.

   (c) Remove bolts, nuts, and clamps securing tubes to HPC case bracket and Flange H bracket and Flange E bracket. Remove tubes from engine and install protective closures.

(7) Remove HPC air valve and air shutoff valve supply tube assembly (AA22) as follows.

   (a) Remove lockwire and disconnect tube nut from tube coupling adjacent to air filters at approximately 11 o'clock position forward of Flange J.

   (b) Remove lockwire and disconnect tube nut from air valve solenoid at approximately 10 o'clock position near Flange E.

   (c) Remove bolts, nuts, and clamps securing tube to HPC case bracket, Flange H bracket and Flange E bracket. Remove tube from engine and install protective closures.

(8) Remove main bearing oil pressure tube (LP05) as follows:

   (a) Remove lockwire and disconnect tube from adapter on last chance strainer housing at approximately 9:30 o'clock position at Flange E.

(b) Remove lockwire and disconnect tube nut from fuel/oil cooler adapter at approximately 9 o'clock position.

(c) Remove the bolts, nuts, clamps and bracket that attaches the main bearing oil pressure tube (LP05) to the main bearing breather tube (LB06). See View N (Post SB PW4ENG 79-33).

(d) Remove bolt and clamp securing tube to Flange E bracket and remove tube from engine.

(e) Remove and discard retainer and packing. Install protective closures.

(9) Airflow check No. 1, 1.5, and 2 bearing oil nozzles. See Figure 302.

(a) Install PWA 85564 Adapter in the last chance strainer housing.

(b) Secure air supply hose from CTE 6070 Airflow Cart or CTE 5070 Airflow Cart to larger threaded hole of adapter. Secure pressure sensing line of the airflow cart to smaller threaded hole in adapter.

(c) Airflow check nozzles at 10 psig (68.9 kPa). Write the value of the airflow. Call this value the base airflow value.

NOTE: The airflow value that is for test equipment and reference only is 40 - 57 lb/hr (18.14 - 25.85 kg/hr).

(d) Remove the adapter and cart.

(10) Remove the main bearing oil pressure manifold assembly (LP07) as follows:

(a) Remove lockwire and last chance strainer from strainer housing attached to Flange E bracket. Remove and discard packing.

(b) Remove bolts securing front flanged end of manifold to case.

(c) Remove bolt, nut, and clamp securing strainer housing to Flange E bracket. Remove manifold from engine. Remove packing and install protective closures.

(11) Remove main bearing breather tube assemblies (LB06) and (LB01) as follows.

(a) Remove lockwire and disconnect (LB01) tube nut from (LB06) tube coupling at approximately 11:30 o'clock position near Flange E.

(b) Remove lockwire and disconnect (LB06) tube nut from tube coupling above fuel/oil cooler at approximately 9 o'clock position.

(c) Remove bolts, nuts, and clamps securing (LB06) tube to HPC case brackets at approximately 11:30 o'clock position and 10 o'clock position. Remove tube from engine and install protective closures.

(d) Remove bolts and lockwashers securing (LB01) tube to intermediate case. Remove tube from engine. Discard gasket and lockwashers. Install protective closures.

R CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH
R CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND
R INSTALL A TUBE WITH A FLEX SEGMENT WITH THE
R SAME PRECAUTION USED FOR A TUBE WITHOUT A
R FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A
R TUBE TO HELP WITH THE INSTALLATION OR REMOVAL
R OF THE TUBE OR AN ATTACHED COMPONENT. IF A
R FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE
R A KINK IN THE EXTERNAL WIRE BRAID AND IN THE
R INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND
R LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(12) Remove air/oil cooler outlet oil hose and tube assembly (LP03) as follows.

(a) Remove bolts securing tube flange to air/oil cooler port at approximately 9 o'clock position.

(b) Remove lockwire and disconnect tube nut from fuel/oil cooler bypass valve adapter.

(c) Remove bolt, nut, and clamp securing tube to HPC case bracket rearward of Flange E at approximately 8 o'clock position and remove tube from engine.

(d) Remove and discard packings and retainer. Install protective closures.

(13) Remove HPC valve cooling air tube assembly (AC35) as follows.

(a) Remove two bolts securing front of tube to case at approximately 10 o'clock position.

(b) Remove bolt, nut, and clamp securing tube to bracket and remove tube from engine.

(c) Install protective closures.

(14) Remove bleed valve cylinder hydraulic tube assembly (CP06) and bleed valve cylinder return tube assembly (CR02) as follows. See Figure 303.

NOTE: Be prepared to catch fuel in container with a minimum capacity of 5 U.S. gallons (19 liters).

(a) Remove lockwire and disconnect tube nuts from compressor bleed actuator adapters and from manifold tees at approximately 7 o'clock position.

(b) Remove tubes from engine and install protective closures.

(c) For engines with the two tubes clamped together (Post SB PW4ENG 75-45), remove the bolt, nut, and clamps.

(15) Remove (left) air/oil cooler valve hydraulic tube assembly (CP07) and (left) air/oil cooler valve return tube assembly (CR05) as follows.

(a) Remove lockwire and disconnect tube nuts from air/oil cooler tube adapters and from manifold tees at approximately 8 o'clock position.

(b) Remove return tube from engine and install protective closures.

(c) Remove bolts and clamps securing hydraulic tube to brackets.

(d) Remove hydraulic tube from engine and install protective closures.

(16) Remove compressor stator cylinder hydraulic tube assembly (CP12) and compressor stator cylinder return tube assembly (CR03) as follows.

(a) Remove lockwire and disconnect tube nuts from compressor stator vane actuator adapters and manifold tees at approximately 4:30 o'clock position.

(b) Remove bolts and clamps securing hydraulic and return tubes to Flange E bracket. Remove tubes and install protective closures.

(17) Remove (right) air/oil cooler valve hydraulic tube assembly (CP13) and (right) air/oil cooler valve return tube assembly (CR12) as follows.

(a) Remove lockwire and disconnect tube nuts from manifold tees and from air/oil heat exchanger tube adapters.

(b) Remove tubes from engine and install protective closures.

(18) Remove (right) hydraulic manifold assembly (CP05) and (right) oil cooler inlet return manifold assembly (CR01) as follows.

(a) Remove lockwire and disconnect flex hose nuts from manifold couplings at approximately 3 o'clock position.

(b) Remove lockwire and disconnect manifold nuts from manifold tees at approximately 5 o'clock position.

(c) Remove bolts, nuts, and clamps securing manifolds to brackets.

(d) Remove manifolds from engine and install protective closures.

(19) Remove (bottom) hydraulic manifold assembly (CP02) and (bottom) oil cooler inlet return manifold assembly (CR04) as follows.

R
R

(a) Remove lockwire and disconnect manifold nut from adapter located on front side of fuel/oil cooler.

(b) Remove bolts and clamps securing manifolds to brackets.

(c) Remove manifolds from engine and install protective closures.

(20) Remove angle gearbox oil pressure tube assembly (LP09) as follows.

(a) Remove lockwire and disconnect tube nut from adapter on right side of angle gearbox.

(b) Remove lockwire and disconnect tube nut from tube tee at approximately 7:30 o'clock position.

(c) Remove bolts, nuts, and clamps securing tube to brackets.

(d) Remove tube from engine and install protective closures.

(21) Remove (right) HPC air valve signal tube assembly (AA01) and (right) HPC air valve supply tube assembly (AA25) as follows. See Figure 304.

(a) Remove lockwire and disconnect tube nuts from air valve solenoid at approximately 1 o'clock position near Flange E.

(b) Remove lockwire and disconnect tube nuts from lower filter and tee forward of Flange J at approximately 2 o'clock position.

(c) Remove bolts, nuts, and clamps securing tubes to brackets.

(d) Remove tubes from engine and install protective closures.

(22) Remove (upper right) airframe cooler outlet oil tube assembly (LS03) and (lower right) airframe cooler outlet oil tube assembly (LS06) as follows.

(a) Remove three bolts securing (upper right) tube to air/oil heat exchanger at approximately 3 o'clock position near Flange E.

(b) Remove lockwire and disconnect (upper right) tube from (lower right) tube at approximately 3:30 o'clock position.

(c) Remove (upper right) tube and install protective closures.

(d) Remove lockwire and disconnect (lower right) tube nut from tube coupling at approximately 5 o'clock position.

(e) Remove bolt, nut, and clamp securing tube to bracket attached to stator vane lever support.

(f) Remove bolt, nut, and clamp securing tube to Flange H bracket at approximately 4:30 o'clock position. Remove (lower right) tube from engine.

(g) Remove packing and discard. Install protective closures.

(23) Remove bleed valve supply tube assemblies (AA26), (AA27), (AA29). See Figure 304 (Sheets 5 and 6) for (SB PW4ENG 75-28) configurations.

(a) Remove lockwire and disconnect tube nuts from tube couplings just below turbine cooling air valve actuator at approximately 2 o'clock position.

(b) For engines equipped with maintenance break in (left) bleed valve supply tube at 3 o'clock position (Pre SB PW4ENG 75-28), remove lockwire and disconnect.

(c) Remove lockwire and disconnect two tubes from solenoid at 5 o'clock position.

(d) For engines not equipped with maintenance break in (left) bleed valve supply tube at 5 o'clock position (Pre SB PW4ENG 75-28), remove lockwire and disconnect tube from pneumatic relay valve.

(e) For engines equipped with maintenance break in (left) bleed valve supply tube at 5 o'clock position (Post SB PW4ENG 75-28), remove lockwire and disconnect.

(f) Remove bolts, nuts, spacer, and clamps securing all supply tubes to brackets and to each other. Remove tubes and install protective closures.

(24) Disconnect No. 3 bearing air cooler tube assemblies (AP33) and (AP34) as follows.

(a) Remove lockwire and disconnect tube nuts from air cooler at approximately 2 o'clock position at Flange E.

(25) If HPC is to be disassembled further, comply with the following:

(a) Remove oil cooler inlet fuel tube assemblies (FM10) and (FM12) as follows. See Figure 305.

(b) Remove lockwire and disconnect (FM12) tube nut from fuel/oil cooler forward outboard adapter.

(c) Remove bolts, nuts, and clamps securing tube to HPC case brackets. Remove tube from engine.

(d) Remove and discard retainer and packing. Install protective closures.

(e) Remove lockwire and disconnect (FM10) tube nut from fuel/oil cooler forward inboard adapter.

(f) Remove bolts, nuts, and clamps securing tube to adjacent tube. Remove tube from engine.

(g) Remove and discard retainer and packing. Install protective closures.

(26) Remove (airframe) oil cooler inlet oil tube assembly (LS05) as follows.

(a) Remove lockwire and disconnect tube nut from oil bypass valve forward adapter. Remove tube from engine. Remove clamps.

(b) Remove and discard retainer and packing. Install protective closures.

(27) Remove oil cooler outlet fuel tube assembly (FM11) (Pre SB PW4ENG 73−35) or oil cooler outlet fuel hose and tube assembly (FM11) (Post SB PW4ENG 73−35) as follows.

(a) Remove lockwire and disconnect nut from fuel/oil cooler rearward adapter.

(b) (Post SB PW4ENG 75-95 and Pre SB PW4ENG 75-144) Remove the bolt, nut and clamps from the oil cooler outlet fuel tube (FM11) and the No. 3 bearing breather valve air supply tube assembly (AP39).

(c) Remove bolt, nut (if equipped), and clamp securing tube to Flange J bracket at approximately 7 o'clock position. Remove tube from engine.

(d) Remove and discard retainer and packing. Install protective closures.

(28) Remove (lower) No. 1, 1.5, and 2 bearing breather oil tube assembly (LB02). See Figure 306.

(a) Remove the bolt, nut and clamp that attaches the No. 1 and 2 bearing breather tube (lower (LB02) to the inboard oil cooler bracket (Post SB PW4ENG 79-33).

(b) Remove bolt, nut, and clamp securing tube to Flange H bracket at approximately 9 o'clock position and remove tube from engine.

(c) Install protective closures.

(29) Remove (front) No. 3 bearing pressure oil manifold assembly (LP18) and (lower) No. 3 bearing oil breather tube assembly (LB04) as follows.

CAUTION: YOU MUST USE THE WRENCHING FLATS ON THE MATTING PARTS WHEN YOU LOOSEN OR TIGHTEN THE RESTRICTOR OR TUBE NUTS. THIS WILL PREVENT ANY TWIST DAMAGE TO THE TUBES.

(a) Remove lockwire. While you hold the restrictor with a wrench, loosen and remove the restrictor from the oil trim pressure tube (LP31). While you hold the oil manifold tee (LP18) with a wrench, loosen and remove the oil trim pressure tube (LP31).

(b) Remove bolt and clamp securing pressure manifold to bracket attached to rear support of fuel/oil cooler. Remove pressure manifold from engine.

R
R

(c) Remove retainer and packing and discard. Install protective closures.

(d) Remove breather tube from engine and install protective closures.

(30) Remove gearbox oil pressure manifold assembly (LP08) as follows.

(a) Remove lockwire and disconnect manifold nut from inboard adapter at top of fuel/oil cooler.

(b) (Post SB PW4ENG 72-491) Remove bolt and clamp that holds the tube to Flange H bracket assembly at approximately 9 o'clock position.

(c) Remove tube from engine and install protective closures.

(31) For engines equipped with engine propulsion multiplexer unit (PMUX), remove (upper) PT2.5 sensing tube assembly (AS30) as follows. See Figure 307.

(a) Remove lockwire and disconnect lower manifold nut (AS31) from tube coupling at approximately 4 o'clock position rear of Flange E.

(b) Remove bolts and clamps securing tube to Flange E at three locations between 1 o'clock and 4 o'clock position.

(c) Remove tube from engine and install protective closures.

(32) For engines equipped with engine propulsion multiplexer unit (PMUX), remove (lower) PT2.5 sensing manifold assembly (AS31) as follows.

(a) Remove bolts, nuts, and clamps securing manifold to Flange E bracket, at approximately 5 o'clock position and HPC case bracket at approximately 4:30 o'clock position.

(b) Remove tube from engine and install protective closures.

(33) For engines with commonality parts between Airbus and McDonnell Douglas, remove the upper PT2.5 sensing tube assembly (AS30) as follows. See Figure 308.

(a) For engines not equipped with the supplemental control unit (SCU) with multiplexing, remove the lockwire from the cap assembly. Remove the cap assembly from the tube.

(b) For engines equipped with the supplemental control unit (SCU) with multiplexing, remove the lockwire and disconnect the lower tube nut from the tube coupling on tube (AS30) at approximately the 4 o'clock position rearward of Flange E.

(c) Remove the bolts, clamps and a nut that attach the tube (AS30) to brackets on Flange E at the 1, 1:30, 2:30 and 3:30 o'clock positions.

(d) Remove the tube from the engine and install protection covers.

(34) For engines with commonality parts between Airbus and McDonnell Douglas with the supplemental control unit (SCU) with multiplexing, remove the lower PT2.5 sensing tube assembly (AS35).

(a) Remove the bolts and clamps that attach the (AS35) tube to brackets on Flange E at the 4:30 and 5:00 o'clock positions.

(b) Remove the tube from the engine and install protection covers.

NOTE: The lower manifold (AS31) was previously removed with the EEC speed transducer (N1) multiplexer input probe.

ENGINE GENERAL - INTERMEDIATE CASE - REMOVAL-03

Task 72-00-34-050-001:

1. Remove Electronic Engine Control (EEC) Speed Transducer (N1)
   A. Prerequisites
      (1) Remove the fan exit liner segment (inner rear) that is at 5 o'clock. Refer to 72-00-33, Removal-16 (Task 72-00-33-040-001).
   B. Equipment And Materials Required - None
   C. Procedure
      See Figure 301.
      (1) Disconnect W4P19 harness connector from transducer.
      (2) If required, bend tabs of key washers down. Evenly loosen bolts and nut (if equipped) securing spring loaded transducer flange to intermediate case. Remove bolts, nut (if equipped) washers, and, if applicable, bracket. Discard key washers if used.
      (3) Withdraw speed transducer from case.

         NOTE: If equipped, use the jackscrew holes in the transducer flange. Do not attempt to rotate transducer until disengaged from inner bracket.

      (4) Remove and discard three packings from transducer.
      (5) Install protective closures.

         NOTE: For additional information concerning detailed maintenance of this component see EEC Speed Transducer (N1) Component Maintenance Manual, 73-21-50 (PW Manual PN 50A449).

Task 72-00-34-050-002:

1. Remove No. 1 Bearing Support (Front And Rear) Assembly

NOTE: See Figure 301 for part/assembly removal procedure sequence.

A. Prerequisites

(1) Remove low pressure compressor (LPC). See 72-00-31, Removal-01 Task 72-00-31-020-003.

B. Equipment And Materials Required

Special Tools:
PWA 85367 Adapter, Handling
PWA 85368 Arm, Lifting

C. Procedure
See Figure 302.

R (1) Remove the No. 1 bearing vibration transducer. Refer
R to 72-00-34, Removal-22 (Task 72-00-34-040-001).

R (2) Remove 48 bolts and washers securing support assembly to engine.

R (3) Attach PWA 85368 Arm to PWA 85367 Adapter and using hoist (at third hold from outside of arm) position adapter to front end of No. 1 bearing support assembly.

R (4) Using mallet remove assembly from intermediate case snap and position assembly on bench. Remove hoist, arm and adapter. Remove packing from rear flange and discard.

R (5) If further disassembly is desired continue with following:

(a) Trunnion front and rear support assembly to front end up.

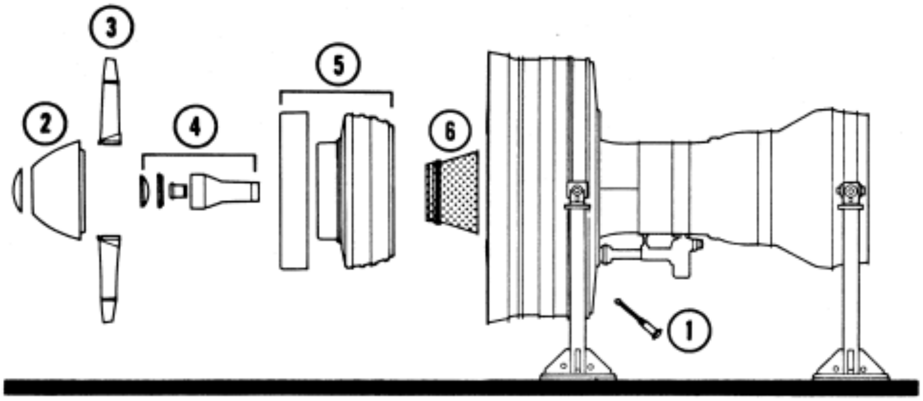
(b) Remove 34 nuts, washers and bolts from bolt circle.

(c) Remove No. 1 bearing (oil) pressure manifold from No. 1 bearing rear support assembly.

1 Remove two bolts and nuts securing manifold to bracket (302/2).

2 Withdraw manifold from bracket (302/1).

(d) Remove front support from rear support. Discard packing from front flange of rear support.



1. REMOVE ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).
2. REMOVE COMPRESSOR INLET CONE.
3. REMOVE STAGE 1 LPC BLADE ASSEMBLIES.
4. REMOVE LPC/LPT COUPLING.
5. REMOVE LOW PRESSURE COMPRESSOR (LPC).
6. REMOVE NO. 1 BEARING SUPPORT ASSEMBLY.

ENGINE GENERAL - INTERMEDIATE CASE - REMOVAL-05

Task 72-00-34-050-003:

1. Remove EEC Fan Case Wiring Harnesses W1 And W2 - Relocated

   NOTE: Removal Of EEC Fan Case Wiring Harnesses W1 And W2 Has Been Relocated To 72-00-33, Removal-06

Task 72-00-34-050-004:

2. Remove EEC Core Engine Wiring Harnesses W3, W4 And W5 - Relocated

   NOTE: Removal Of EEC Core Engine Wiring Harnesses W3, W4, And W5 Has Been Relocated To 72-00-34, Removal-18, Removal-19, And Removal-20 Respectively.

ENGINE GENERAL - INTERMEDIATE CASE - REMOVAL-06

Task 72-00-34-030-001:

1. Remove No. 1.5 Bearing Support Assembly
   A. Prerequisites
      (1) Remove No. 1 bearing support (front and rear) assembly. See Removal-04 (Task 72-00-34-050-002).
   B. Equipment And Materials Required

      Special Tools:
      PWA 29855-3 Pin (2 Necessary)
      PWA 85366 Adapter, Handling (Optional to PWA 87316)
      PWA 85368 Arm, Lifting
      PWA 85518 Puller
      PWA 87316 Adapter, Handling

   C. Procedure
      (1) Remove the gearbox driveshaft assembly. See Figure 301.
         (a) Put a container under the angle gearbox to collect oil.
         (b) Remove the retaining ring from the plug (gearbox cover).
         (c) With PWA 85518 Puller, remove the plug (gearbox cover). Discard the packing.
         (d) Remove the retaining ring that is in the angle gearbox.
         (e) Remove the gearbox driveshaft assembly.
      (2) Remove the main bearing (inner) scavenge tube assembly (called tube). See Figure 302.
         (a) Remove the bolt and nut that attach the bracket to the No. 1.5 bearing support assembly.
         (b) Remove the three bolts that attach the tube to intermediate case.
         (c) Remove the tube. Discard the gasket. Remove the clamp from the tube.
      (3) Disconnect the main bearing tube connector from the intermediate case. See Figure 302.
         (a) Remove the three bolts that attach the tube connector to the ID of the intermediate case.
         (b) Push the tube connector into the connector on the support assembly.
         (c) Remove and discard the gasket.
      (4) Remove the No. 1.5 bearing support assembly. See Figure 303.
         (a) Install two PWA 29855-3 Pins in threaded holes in the rear ID of the intermediate case at 2 and 10 o'clock.
         (b) Attach PWA 85366 Adapter to the support assembly:
            1 Attach PWA 85368 Arm to the threaded rod at the center of the adapter.
            2 Attach a hoist to the arm. Lift the tools.

(Task 72−00−34−030−001)

3 Attach the adapter to the front flange of the support assembly with the detail screws.

(c) Remove the support assembly:

1 Install 1/4−28 jackscrews in the three threaded holes in the rear flange of the support assembly, at 4, 8, and 12 o'clock.

2 Remove the 33 bolts that attach the rear flange of the support assembly to the intermediate case.

CAUTION: BE CAREFUL OF THE NO. 2 BEARING (OIL) PRESSURE TUBE WHEN YOU REMOVE THE SUPPORT ASSEMBLY.

3 With the jackscrews, slowly remove the support assembly.

4 Put the support assembly on a bench, front end down.

5 Remove the jackscrews.

6 Remove the tools.

(d) If you will trunnion the intermediate case, install workbolts to replace the 33 bolts you removed.

(5) Remove the No. 2 bearing (oil) pressure tube (Pre SB PW4ENG 72−394) or oil shut−off valve (Post SB PW4ENG 72−394) from the No. 2 bearing housing. If applicable, remove and discard the packings. See Figure 304.

(6) Remove the main bearing tube connector from the support assembly. See Figure 302.

(a) Pull the tube connector out of the connector on the support assembly.

(b) Remove and discard the packing, if applicable.

ENGINE GENERAL − INTERMEDIATE CASE − REMOVAL−07

Task 72−00−34−030−002:

1. Remove The 4th Stage Compressor Stator Assembly
   - A. Prerequisites
     - (1) Remove the low pressure compressor (LPC). See 72−00−31, Removal−01 (Task 72−00−31−020−003).
     - (2) Remove the fan exit liner segment (inner rear) that is at 11 or 1 o'clock. Refer to 72−00−33, Removal−16 (Task 72−00−33−040−001).
   - B. Equipment And Materials Required

     Special Tools:
     PWA 85905 Fixture, Assemble/Disassemble

   - C. Procedure
     See Figure 301.

     - (1) Remove the 24 bolts and washers that attach the stator assembly to the intermediate case.
     - (2) Assemble PWA 85905 Fixture.
       - (a) Put the jaw marked "Remove" on the screw.
       - (b) Put the jaw approximately 1.5 inch (38.100 mm) from the body.
       - (c) Have the same quantity of threads at both ends.
       - (d) Engage the fixture in the tabs of the stator assembly and intermediate case at 11 o'clock.
       - (e) While you hold the stator assembly, turn the screw to disengage the tabs of the two assemblies.
       - (f) Remove the stator assembly. Discard the packings.

ENGINE GENERAL - INTERMEDIATE CASE - REMOVAL-08

Task 72-00-34-050-005:

1. Remove Air/Oil Heat Exchanger And Valve (IDGS)

A. Prerequisites

(1) Remove the fan exit liner segment (inner rear) that is at 4 o'clock. Refer to 72-00-33, Removal-16 (Task 72-00-33-040-001).

B. Equipment And Materials Necessary

Special Tools:

PWA 85853	Adapter, Torque
PWA 102285	Adapter, Torque

C. Procedure
See Figure 301.

NOTE: Items referred to as numbers in parenthesis in text are shown in Figure 301.

(1) Remove two bolts (301/20) and harness bracket (301/21) securing valve cable receptacle to bracket on stator vane actuator support (301/22). Remove receptacle from bracket. Install protective closure.

(2) Remove bolts and nuts securing harness clamps to air/oil cooler valve return tube (301/17).

(3) Remove lockwire and disconnect air/oil cooler valve hydraulic and return tubes (CP13), (CR12) (301/18, 301/17) at heat exchanger adapters.

NOTE: Hold bulkhead adapters with wrench while loosening tube nuts at heat exchanger.

(4) Remove airframe cooler outlet oil tube (LS03) (upper right) (301/30) as follows:

(a) Remove three bolts (301/27) securing tube swivel collar (301/28) to heat exchanger.

(b) Remove lockwire and disconnect tube coupling nut (301/31) from tube coupling. Remove tube from heat exchanger.

(c) Discard packing (301/29). Install protective closures.

(5) (Pre SB PW4ENG 79−60), Remove the four outboard bolts and the four inboard bolts (301/10), and washers (301/9) as follows.

  (a) Remove the four outboard bolts and washers that attach the valve inlet collars to the rear of the intermediate case.

  (b) Use PWA 85853 Torque Adapter to remove the four inboard bolts and washers that attach the valve inlet collars to the rear of the intermediate case.

(6) (Post SB PW4ENG 79−60), Remove the four outboard bolt and washer assemblies and the four inboard bolt and washer assemblies from the valve inlet collars as follows.

  (a) Remove the four outboard bolt and washer assemblies that attach the valve inlet collars to the rear of the intermediate case.

  (b) Use PWA 85853 Torque Adapter to remove the four inboard bolt and washer assemblies that attach the valve inlet collars to the rear of the intermediate case.

  NOTE: The washers are captive (part of) of the washer and bolt assembly.

(7) Remove two bolts (301/11) and washers (301/12) securing bracket (301/24) on forward side of valve to intermediate case.

(8) Remove four bolts (301/14, 301/15) using PWA 102285 Torque Adapter securing lower bracket (301/13) to heat exchanger and to bracket (301/16) on intermediate case. Remove bracket (301/13).

CAUTION: DO NOT HANDLE HEAT EXCHANGER VALVE AND HEAT EXCHANGER BY INLET COLLARS. INLET COLLARS ARE NOT INTEGRAL PARTS OF VALVE HOUSING.

(9) Remove four bolts (301/5, 301/7) using PWA 102285 Torque Adapter securing upper bracket (301/6) to heat

exchanger and to bracket (301/26) on intermediate case. Remove heat exchanger and valve from engine.

NOTE: For additional information concerning detailed maintenance of this component see Air/Oil Heat Exchanger Valve (IDGS) Component Maintenance Manual, 75−24−20 (Hamilton Standard) and Air/Oil Heat Exchange (IDGS) Component Maintenance Manual, 24−11−01 (Hughes Treitler).

Air/Oil Heat Exchanger And Valve (IDGS)
Figure 301 (Sheet 1)
(Task 72−00−34−050−005)

ENGINE GENERAL - INTERMEDIATE CASE - REMOVAL-09

Task 72-00-34-050-006:

1. Remove Valve From Air/Oil Heat Exchanger (IDGS)

A. Prerequisites

(1) Remove Air/Oil Heat Exchanger And Valve (IDGS). See Removal-08 Task 72-00-34-050-005.

B. Equipment And Materials Necessary

Special Tools

PWA 102285	Adapter, Torque

C. Procedure
See Figure 301, Figure 302, and Figure 303.

NOTE: Items referred to in parenthesis in the text are identified in the figures.

CAUTION: DO NOT LIFT THE HEAT EXCHANGER VALVE AND/OR HEAT EXCHANGER BY THE INLET COLLARS. THE INLET COLLARS ARE NOT AN INTEGRAL PART OF THE VALVE HOUSING.

(1) Place the air/oil heat exchanger and valve on bench.

(2) (Pre SB PW4ENG 79-49) Remove the lockwire and jamnuts which secure the three tubes to the bracket on heat exchanger.

(3) (Post SB PW4ENG 79-49) Remove the lockwire, jamnuts, washers and plate which secure the three tubes to the bracket on the exchanger.

(4) Remove the bolt which secures the tube clamp to the cable shield. Remove the clamp.

(5) Remove the bolts, nuts and washers from the valve and heat exchanger mating flange.

(6) Separate the valve from the heat exchanger.

(7) If a new valve is to be installed, comply with the following:

(a) Disconnect and remove the three tubes from the adapters.

(b) Remove the three adapters from valve ports and discard packings. Install the protective closures.

(c) (Post SB PW4ENG 24−4) Remove the plug from the end of the valve and discard the packing.

(8) If a new heat exchanger is to be installed, comply with the following:

(a) Remove the bolts, using PWA 102285 Torque Adapter, which secure the lower mount bracket and the upper mount bracket to the heat exchanger. Remove the brackets.

NOTE: For additional information concerning detailed maintainance of this component see Air/Oil Heat Exchanger Valve (IDGS) Component Maintenance Manual, 75−24−20 (Hamilton Standard Division) and Air/Oil Heat Exchanger (IDGS) Component Maintenance Manual, 24−11−01 (Hughes Treitler).

Task 72-00-34-050-007:

1. Remove Air/Oil Heat Exchanger And Valve (Engine)

A. Prerequisites

(1) Remove the fan exit liner segment (inner rear) that is at 8 o'clock. Refer to 72-00-33, Removal-16 (Task 72-00-33-040-001).

B. Equipment And Materials Necessary

Special Tools:

PWA 85853	Adapter, Torque
PWA 102285	Adapter, Torque

C. Procedure
See Figure 301.

NOTE: Items referred to as numbers in parenthesis in text are identified in Figure 301.

(1) Disconnect the W3P17 harness connector from the air/oil cooler heat exchanger cable connector. Install a protective closure on the harness connector.

(2) Remove two bolts (301/20) and harness bracket securing valve cable receptacle to bracket on HPC case. Remove receptacle from bracket and install protective closure.

(3) Remove lockwire and disconnect air/oil cooler valve hydraulic tube (CP08) (301/18) and air/oil cooler valve hydraulic return tube (CR08) (301/19) from heat exchanger adapters.

NOTE: Hold bulkhead adapters with wrench while loosening tube nuts at heat exchanger.

(4) Remove air cooler inlet oil tube (LP02) (301/29).

(a) Remove bolt, and nut securing W3/W5 harness to bracket clamp to air cooler inlet oil tube.

(b) Remove bolts securing tube flange to air cooler.

(c) Remove three bolts securing other end of tube to oil filter housing. Disengage tube and discard packings. Install protective closures.

R
R

R CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH
R CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND
R INSTALL A TUBE WITH A FLEX SEGMENT WITH THE
R SAME PRECAUTION USED FOR A TUBE WITHOUT A
R FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A
R TUBE TO HELP WITH THE INSTALLATION OR REMOVAL
R OF THE TUBE OR AN ATTACHED COMPONENT. IF A
R FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE
R A KINK IN THE EXTERNAL WIRE BRAID AND IN THE
R INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND
R LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(5) Disconnect air cooler outlet oil hose and tube (LP03) (301/28).

(a) Remove bolts securing tube flange to air cooler.

(b) Disengage tube and discard packings. Install protective closures.

(6) Remove bolt (301/16) using PWA 102285 Torque Adapter, securing cable conduit to lower bracket (301/11) on intermediate case.

(7) Remove bolt (301/14) using PWA 102285 Torque Adapter, securing rear end of cable conduit to lower bracket (301/11) on intermediate case.

(8) (Pre SB PW4ENG 79−60), Remove the four outboard bolts (301/23) and washers (301/24), and loosen the four inboard bolts (301/23) as follows.

(a) Remove the four outboard bolts (301/23) and washers (301/24) that attach the valve inlet collars to the rear of the intermediate case.

(b) Use PWA 85853 Torque Adapter to loosen the four inboard bolts and washers that attach the valve inlet collars to the rear of the intermediate case. Do not remove the inboard bolts and washers from the intermediate case.

NOTE: The four bolt holes in the valve inlet collars are slotted to make easier the removal of the exchanger and valve.

(9) (Post SB PW4ENG 79-60), Remove the four outboard bolt and washer assemblies, and loosen the four inboard bolt and washer assemblies from the valve inlet collars as follows.

(a) Remove the four outboard bolt and washer assemblies that attach the valve inlet collars to the rear of the intermediate case.

(b) Use PWA 85853 Torque Adapter to loosen the four inboard bolt and washer assemblies that attach the valve inlet collars to the rear of the intermediate case. Do not remove the inboard bolt and washer assemblies from the intermediate case.

NOTE: The washers are captive (part of) of the washer and bolt assembly.

(10) Remove two bolts (301/8) and washers (301/7) securing bracket on forward side of valve to intermediate case.

(11) Remove four bolts (301/15, 301/17) using PWA 102285 Torque Adapter, securing lower bracket (301/9) to heat exchanger and to bracket (301/11) on intermediate case. Remove bracket (301/9).

CAUTION: DO NOT HANDLE HEAT EXCHANGER VALVE AND HEAT EXCHANGER BY INLET COLLARS. INLET COLLARS ARE NOT INTEGRAL PARTS OF THE VALVE HOUSING.

(12) Remove two bolts (301/26) using PWA 102285 Torque Adapter, securing upper bracket (301/25) to bracket (301/5) on intermediate case.

(13) Move heat exchanger and valve outward to disengage inlet collars from inboard bolts. Allow heat exchanger and valve to drop slightly to access bolts (301/27). Remove two bolts (301/27) using PWA 102285 Torque Adapter, and bracket (301/25) from top of heat exchanger and valve.

(14) Rotate heat exchanger and valve (top outward) to remove from intermediate case opening while guiding cable and conduit out with heat exchanger and valve.

(15) Install protective closures to remaining openings.

NOTE: For additional information concerning detailed maintenance of this component see Air/Oil Heat Exchanger Valve (Engine) Component Maintenance Manual, 75−24−18 (Hamilton Standard) and Air/Oil Heat Exchanger (Engine) Component Maintenance Manual, 79−21−20 (Hughes Treitler).

ENGINE GENERAL - INTERMEDIATE CASE - REMOVAL-11

Task 72-00-34-050-008:

1. Remove Valve From Air/Oil Heat Exchanger (Engine)

A. Prerequisites

(1) Remove Air/Oil Heat Exchanger And Valve (Engine). See Removal-10 Task 72-00-34-050-007.

B. Equipment And Materials Necessary

Special Tools

PWA 102285	Adapter, Torque

C. Procedure
See Figure 301, Figure 302, Figure 303.

NOTE: Items referred to in parenthesis in the text are identified in the Figures.

CAUTION: DO NOT HANDLE THE HEAT EXCHANGER VALVE AND/OR HEAT EXCHANGER BY THE INLET COLLARS. THE INLET COLLARS ARE NOT INTEGRAL PARTS OF THE VALVE HOUSING.

(1) Place the air/oil heat exchanger and valve on the bench.

(2) (Pre SB PW4ENG 79-49) Remove the lockwire and jamnuts which secure the three tubes to the flange on the heat exchanger.

(3) (Post SB PW4ENG 79-49), (Pre SB PW4ENG 79-50) Remove the lockwire, jamnuts, washers and plate which secure the three tubes to the flange on the exchanger.

(4) (Post SB PW4ENG 79-50) Remove the lockwire and bolts which secure the three tubes to the exchanger.

(5) Remove the bolts, nuts, washers and if equipped brackets from the valve and heat exchange mating flange. See the figure.

(6) Separate the valve from the heat exchanger.

(7) If a new valve is to be installed, comply with the following:

(a) Disconnect and remove the three tubes from the adapters on the end of the valve.

(b) Remove the bolts, nut, and clamps which secure the (CR09) tube and the (CP08) tube.

(c) (Pre SB PW4ENG 79−49) Remove the nuts which secure the tubes to the exchanger.

(d) (Pre SB PW4ENG 79−50) Remove the nuts, washers and plate which secure the tubes to the exchange.

(e) (Post SB PW4ENG 79−50) Remove the bolts that secure the tubes to the exchange.

(f) Remove the three adapters from the valve ports and discard the packings. Install the protective closures.

(8) If a new heat exchanger is to be installed, comply with the following:

(a) Remove the bolts, using PWA 102285 Torque Adapter, which secure the lower and upper mount brackets to the heat exchanger. Remove the brackets.

NOTE: For additional information concerning detailed maintainance of this component. See Air/Oil Heat Exchanger Valve (Engine) Component Maintenance Manual, 75−24−18 (Hamilton Standard Division) and Air/Oil Heat Exchanger (Engine) Component Maintenance Manual, 79−21−20 (Hughes Treitler).

ENGINE GENERAL - INTERMEDIATE CASE - REMOVAL-12

Task 72-00-34-050-009:

1. Remove HPC Secondary Flow Control Valve, IDGS Air/Oil Heat Exchanger Valve Override Solenoid

A. Prerequisites

(1) Remove the fan exit liner segment (inner rear) that is at the 1 o'clock position. Refer to 72-00-33, Removal-16 Task 72-00-33-040-001.

B. Equipment And Materials Required - None

C. Procedure
See Figure 301.

(1) Disconnect and remove the W1P10 and W1P11 harness connectors from the solenoid.

(2) Remove the lockwire from the two tube nuts on the rear of the solenoid and disconnect the tubes.

(3) Remove the lockwire from the pressure switch tube nuts. Disconnect and remove the tube. Install protective closures to the tube.

(4) Remove the four bolts that attach the solenoid and the pressure switch bracket to the case. Remove the bracket and solenoid from the engine and install protective closures.

(5) If the solenoid must be replaced, do the following:

(a) Remove the two adapters, one plug, and three gaskets from the rear of the solenoid.

(b) Remove the cap, two adapters, and two gaskets from the top of the solenoid.

(c) Install protective closures to all openings on the solenoid.

NOTE: For additional information concerning detailed maintenance of this component, see Compressor Heating Air/Turbine Vane Cooling Air Valve Solenoid Component Maintenance Manual, 75-33-10 (Midland Ross).

ENGINE GENERAL - INTERMEDIATE CASE - REMOVAL-13

Task 72-00-34-050-010:

1. Remove The Start/Stability Bleed Valve Solenoid
   - A. Prerequisites
     - (1) Remove the fan exit liner segment (inner rear) that is at 5 o'clock. Refer to 72-00-33, Removal-16 (Task 72-00-33-040-001).
   - B. Equipment And Materials Required - None
   - C. Procedure

     See Figure 301.
     - (1) Disconnect W4P4 and W5P11 harness connector from solenoid.
     - (2) For (Pre SB PW4ENG 75-28) engines, remove the bleed valve supply tubes as follows. See Figure 301 (Sheet 1).
       - (a) Remove the lockwire. Disconnect the (AA35) and (AA36) tubes at both ends of each tube.
       - (b) Remove the tubes and install the protection covers.
     - (3) For (Post SB PW4ENG 75-28 and Pre SB PW4ENG 75-41) engines, remove the bleed valve supply tubes as follows. See Figure 301 (Sheet 2).
       - (a) Remove the lockwire. Disconnect the (AA35), (AA36), and (AA37) tubes at both ends of each tube.
       - (b) Remove the tubes. Remove the bolt, spacer, nut, and clamps that attach the (AA36) and (AA37) tubes together. Install the protection covers.
     - (4) For (Post SB PW4ENG 75-41) engines, remove the bleed valve supply tubes as follows. See Figure 301 (Sheet 3).
       - (a) Remove the lockwire. Disconnect the (AA35), (AA36), and (AA37) tubes at both ends of each tube.
       - (b) Remove the bolts, nuts, and clamps that attach the tubes to the brackets and to each other.
       - (c) Remove the tubes and install the protection covers.
     - (5) Remove the lockwire and disconnect the (AA26) bleed valve supply tube and the (AA27) bleed valve signal tube from the solenoid.
     - (6) Remove the four bolts that attach the bleed valve bracket assembly to the intermediate case.
     - (7) Remove the four bolts (and bracket, Post SB PW4ENG 75-41 only) that attach the solenoid to the bleed valve bracket. See Figure 301 (Sheet 4). Remove the solenoid and install protection covers.
     - (8) If the solenoid is to be replaced, do as follows.
       - (a) Place valve on bench with adapter cap up facing operator and solenoids to the right.
       - (b) Remove two adapters, one plug, and three gaskets from rear ports of solenoid.
       - (c) Remove cap from adapters and two gaskets from top of solenoid.

ENGINE GENERAL − INTERMEDIATE CASE − REMOVAL−14

Task 72−00−34−050−011:

1. Remove HPC Secondary Flow Control Valve, Turbine Vane And Blade Cooling Air Valve Solenoid

A. Prerequisites

(1) Remove the fan exit liner segment (inner rear) that is at the 10 o'clock position. Refer to 72−00−33, Removal−16 Task 72−00−33−040−001.

B. Equipment And Materials Required − None

C. Procedure
See Figure 301.

(1) Disconnect and remove the W3P12 harness connector from the solenoid.

(2) Remove the lockwire from the three tube nuts on the rear of the solenoid and disconnect the tubes from the solenoid.

(3) Remove the four bolts that attach the solenoid to the intermediate case. Remove the solenoid from under the bracket and from the engine.

NOTE: Loosen the clamp bolt that attaches the tube to the bracket, if necessary.

(4) If the solenoid must be replaced, do the following:

(a) Remove the three adapters and gaskets from the rear of the solenoid.

(b) Remove the lockwire and the two caps from the top of the two adapters.

(c) Remove the two adapters and gaskets from the top of the solenoid.

(d) Install protective closures to all openings.

NOTE: For additional information concerning detailed maintenance of this component, see Compressor Heating Air/Start Bleed Valve Solenoid Component Maintenance Manual, 75−33−12 (Midland Ross).

Task 72-00-34-050-012:

1. Remove IDGS Air/Oil Heat Exchanger Valve Override Pressure Switch

A. Prerequisites

(1) Remove the fan exit liner segment (inner rear) that is at the 1 o'clock position. Refer to 72-00-33, Removal-16 (Task 72-00-33-040-001).

B. Equipment And Materials Required - None

C. Procedure

See Figure 301 or 302.

(1) Remove the lockwire and disconnect the pressure switch tube from the front of the override pressure switch.

(2) Remove the two bolts that attach the override pressure switch to the bracket and remove the override pressure switch from the engine.

(3) Install protective closures as necessary.

ENGINE GENERAL - INTERMEDIATE CASE - REMOVAL-16

Task 72-00-34-050-013:

1. Remove The Stability Bleed Pneumatic Relay Valve
   - A. Prerequisites
     - (1) Remove the start/stability bleed valve solenoid. See Removal-13 (Task 72-00-34-050-010).
   - B. Equipment And Materials Required - None
   - C. Procedure

     See Figure 301.
     - (1) For engines without the bleed valve supply tube maintenance break (Pre SB PW4ENG 75-28), remove the remaining tube nut from the relay valve at 5 o'clock position on the intermediate case.

     - (2) Remove the three bolts and nuts that attach the relay valve to the bracket in the intermediate case at 5 o'clock position. Remove the relay valve.
     - (3) If the pneumatic relay valve is to be replaced, comply with the following:
       - (a) Remove the three adapters and gaskets from the valve.
       - (b) Install the protection covers to all the openings.

         NOTE: For more data about the maintenance of this component, see the Stability Bleed Pneumatic Relay Valve Component Maintenance Manual, 75-31-43.

ENGINE GENERAL - INTERMEDIATE CASE - REMOVAL-17

Task 72-00-34-050-014:

1. Remove EEC Speed Transducer (N1) Multiplexer Input Probe

A. Prerequisites

(1) Remove the fan exit liner segment (inner rear) that is at 5 o'clock. Refer to 72-00-33, Removal-16 (Task 720033040001).

B. Equipment And Materials Required

Special Tools:

PWA 101359 Puller, Mechanical (Pre SB PW4ENG 73-88)

C. Procedure
See Figure 301.

(1) Disconnect cables from connectors on transducer probe.

(2) Remove lockwire and disconnect tube nut from transducer probe.

(3) Remove bolt and clamp securing tube to Flange E bracket at approximately 5 o'clock position.

(4) If required bend key washers down. Evenly loosen bolts and nut (if equipped) securing spring loaded transducer to intermediate case. Remove bolts, and nut (if equipped) and washers. Discard key washers if used.

(5) Reposition bracket (if equipped) and PT2.5 tube to allow removal of transducer from case.

NOTE: Do not attempt to rotate transducer until disengaged from inner bracket.

(6) (Pre SB PW4ENG 73-88) Use PWA 101359 Puller to break the interface between the flange of the transducer probe and the intermediate case.

(7) (Post SB PW4ENG 73-88) Use three .190-32 jackscrews in the transducer flange jackscrew holes to break the interface between the flange of the transducer probe and the intermediate case.

(8) Remove the transducer. Remove the packings and discard.

(9) Install protective closures.

ENGINE GENERAL - INTERMEDIATE CASE - REMOVAL-18

Task 72-00-34-050-018:

1. Remove EEC Wiring Harness - W3 (Core Engine)
   A. General
      (1) To remove the EEC wiring harness - W4, see Removal-19 (Task 72-00-34-050-019).
      (2) To remove the EEC wiring harness - W5, see Removal-20 (Task 72-00-34-050-020).
   B. Equipment And Materials Required

      Special Tools:
      PWA 85749 Torque Adapter, Electronic Harness Connector

   C. Procedure
      See Figures 301 through 308.

      CAUTION: DO NOT TWIST OR BEND THE HARNESS BADLY DURING THE REMOVAL, OR DAMAGE TO THE HARNESS CAN OCCUR.

      (1) Disconnect the W1P24 harness connector from the W3J24 harness connector located at the 10 o'clock position on the HPC case. Remove the two bolts and harness bracket attaching the W3J24 harness connector flange to the HPC case bracket. Remove the connector from the bracket. Install a protective closure on each harness connector. See Figure 303.
      (2) Disconnect the following harness connectors from the components given below. Install a protective closure on each harness connector and mating receptacle. See Figure 302.

Connector	Component	Location
W3P5	Fuel/Oil Cooler Bypass Valve Solenoid (Front Connector)	8 O'Clock
W3P17	Air/Oil Heat Exchanger And Valve (Engine)	8 O'Clock
W3P15	2.5 Bleed Valve Actuator	Intermediate Case 7:30 O'Clock

ENGINE GENERAL - INTERMEDIATE CASE - REMOVAL-19

Task 72-00-34-050-019:

1. Remove EEC Wiring Harness - W4 (Core Engine)
    - A. General
        - (1) To remove the EEC wiring harness - W3, see Removal-18 (Task 72-00-34-050-018).
        - (2) To remove the EEC wiring harness - W5, see Removal-20 (Task 72-00-34-050-020).
    - B. Equipment And Materials Required

      Special Tools:
      PWA 85749 Torque Adapter, Electronic Harness Connector

    - C. Procedure
      See Figures 301 through 309.
        - (1) FOR THESE MODELS: 4152, 4156A, 4158
          (Pre SB PW4ENG 72-572 Or Pre SB PW4ENG 75-106)
            - (a) FOR THESE MODELS: 4152, 4156A, 4158
              Disconnect the W4P10 harness connector from the HPC secondary flow control valve located at the 3:30 o'clock position. Install a protective closure on the harness connector and the mating flow control valve position switch receptacle. See Figure 302 (Sheet 1).
            - (b) FOR THESE MODELS: 4152, 4156A, 4158
              Disconnect the W4P21 harness connector from the turbine vane and blade cooling air valve located at the 3 o'clock position. Install a protective closure on the harness connector and the mating cooling air valve position switch receptacle. See Figure 302 (Sheet 1).

              NOTE: FOR THESE MODELS: 4152, 4156A, 4158
              SB PW4ENG 72-572 Or SB PW4ENG 75-106 removes connectors W4P10 and W4P21 from the W4 wiring harness. See Figure 302 (Sheet 2).

        - (2) Disconnect the following harness connectors from the components given below. Install a protective closure on each harness connector and mating receptacle. See Figure 302.

(3) Remove the bolts, nuts, and clamps that attach the W4 harness to the brackets and tubes on the HPC case. See Figures 303 through 309.

(4) Remove the applicable harness ties and carefully remove the W4 harness.

ENGINE GENERAL − INTERMEDIATE CASE − REMOVAL−20

Task 72−00−34−020−020:

1. Remove The Flange E Brackets And Hardware

A. Equipment And Materials Necessary − None

B. Procedure

(1) Remove the Flange E brackets as follows. See Figure 301.

(a) Tag and identify the flange E hardware for the correct bolthole locations.

NOTE: All the part item numbers in the figures are the same as the item numbers in the IPC.

(b) Remove the bolts, which attach the brackets at Flange E.

Task 72-00-34-020-004:

1. Remove The Fan Unit From The Core Engine

A. Prerequisites

(1) Transfer the engine from the transport stand to pedestals. Refer to 72-00-00, Special Procedures-01 (Task 72-00-00-010-001).

(2) Refer to Table 301 for the other procedures that are prerequisite to this procedure. See Figure 301.

Step	Remove The	Chapter	Removal
1	Magnetic Chip Detector Assemblies In The Oil Tank And Main Gearbox	72-00-61	36 (Task 72-00-61-050-017)
2	Compressor Inlet Cone	72-00-31	02 (Task 72-00-31-020-001)
3a	Electronic Engine Control (EEC) Speed Transducer (N1)	72-00-34	03 (Task 72-00-34-050-001)
or			
3b	EEC Speed Transducer (N1) Multiplexer or SCU Input Speed Probe	72-00-34	17 (Task 72-00-34-050-014)
4	LPC/LPT Coupling*	72-00-32	01 (Task 72-00-32-020-001)

NOTE: *Do not remove the Stage 1 LPC blade assemblies

Other Prerequisite Procedures
Table 301

B. Equipment And Materials Necessary

ENGINE GENERAL − INTERMEDIATE CASE − REMOVAL−21

Special Tools:

PWA 25757	Pedestal (4 Necessary)
PWA 25926	Adapters (4 Necessary)
PWA 29855−7	Aligning Pin (2 Necessary)
PWA 76154	Adapter (2 Necessary)
PWA 76155	Sling
PWA 85260	Guide Pin (2 Necessary)
PWA 85390	Adapter, Lifting
PWA 85429	Wrench
PWA 85471	Wrench, Torque
PWA 85537	Fixture, Handling
PWA 85585	Ring, Guide
PWA 85623	Eye, Lifting
PWA 85631	Guide, Piloting
PWA 85749	Adapter, Torque−Electrical Connector
PWA 85785	Adapter, Piloting
PWA 86209	Retainer, Positioning (Optional To PWA 85537)
PWA 86567	Adapter, Lift And Trunnion (2 Necessary)
PWA 86598	Retainer, Positioning (Optional To PWA 86209)
PWA 88204	Guide, Piloting
PWA 101848	Puller, Jackscrew (6 Necessary)

NOTE: Use PWA 86598 or PWA 86209 Retainer as an alternative to PWA 85537 Fixture if you will remove the HPC top front case with the procedure in 72−00−35, Removal−18 (Task 72−00−35−030−001).

C. Disconnect The EEC Wiring Harnesses As Follows: See Figure 302.

(1) Disconnect the W1 EEC wiring harness as follows.

(a) Use the PWA 85749 Torque Adapter and disconnect the W1P11 and the W1P10 harness connectors from the 1 o'clock position solenoid.

(b) Remove the clamp bolts and nuts that attach the harness to the Flange E bracket and to the solenoid muscle tube.

(c) Disconnect the W1P25 harness connector at the HPC case bracket at 1 o'clock position.

(d) Disconnect the W1P24 harness connector at the HPC case bracket at 10 o'clock position.

(e) Disconnect the W1P9 harness connector at the HPC case bracket at 12 o'clock position.

(f) Remove all the clamp bolts and nuts that attach the W1 harness to the HPC case brackets.

(g) Temporarily attach the W1 harness to the 12 o'clock strut with lockwire. Keep the harness clear of Flange E.

(h) Install protection covers.

(2) Disconnect the W2 EEC wiring harness.

(a) Disconnect the W2P26 harness connector at the HPC case bracket at 12 o'clock position.

(b) Remove the bolt that attaches the retaining bracket and the W2J9 receptacle to the HPC case bracket at 12 o'clock position.

(c) Remove all the clamp bolts that attach the W2 harness to the Flange E bracket and the No. 1, 1.5, and 2 bearing tubes.

(d) Temporarily attach the W2 harness to the 12 o'clock strut with lockwire. Keep the harness clear of Flange E.

(e) Install protection covers.

(3) Remove the two bolts that attach the IDG−heat−exchanger valve harness and retaining bracket to the HPC case bracket. Remove the retaining bracket and disconnect the harness receptacle. Install a protection cover. Remove the two clamp bolts that attach the IDG harness to the hydraulic tube.

(4) Use the PWA 85749 Torque Adapter and disconnect the W4P4 and the W5P11 harness connectors from the 5 o'clock position solenoid. Install protection covers.

(5) Remove the clamp bolt that attaches the W4 harness (to the EEC speed transducer) to the bleed valve supply tube at 5 o'clock position.

(6) Disconnect the W3P15 harness connector from the 2.5 bleed valve actuator at 7 o'clock position. Install protection covers.

(7) Disconnect the W3P17 connector from the (engine) air/oil heat exchanger harness receptacle at 7:30 o'clock position. Remove the two bolts that attach the retaining bracket and receptacle from the HPC case bracket. Install a protection cover on the receptacle.

(8) If removal of the HPC top front case is required per 72−00−35, Removal−18 (Task 72−00−35−030−001), after the engine is split, disassemble the W3, W4, and W5 harnesses from the HPC top front case as follows. See Figure 303.

(a) Remove the bolts, nuts, and spacers that attach the harness clamps to the HPC top front case brackets from 9 o'clock position to 3 o'clock position.

(b) Remove the bolts, nuts, and spacers that attach the harness clamps to the two bracket assemblies above and over the stator vane actuator support.

(c) Remove the bolts and brackets that attach the W4J25 connector, the W5J26 connector, and the W3J24 connector to the HPC case brackets at 1, 12 and 10 o'clock position respectively.

(d) Remove the bolts and nuts that attach the harness clamps to the fuel/oil cooler brackets and to the bracket assembly above the cooler.

(e) Disconnect the W4P16 connector from the TCC air valve actuator.

(f) Disconnect the W5P7 connector and the W4P3 connector from the stator vane actuator.

(g) Remove the bolts and nuts that attach the harness to the bottom of the stator vane actuator support.

(h) Remove the harness bracket assemblies from over the TCC air valve actuator and from over the stator vane actuator support assembly.

(i) Move the harnesses rearward of Flange H and install protection covers to all connectors and receptacles.

D. Disconnect The Tubes As Follows
See Figure 304.

(1) Remove the lockwire and disconnect the EEC PB sensing tubes (AS09/20) at 12:30 o'clock position. See Figure 304 (Sheet 1).

(2) For engines with PMUX or SCU, remove lockwire and disconnect the PT2.5 sensing tubes (AS29/30) at 12:30 o'clock position. See Figure 304 (Sheet 1).

(3) Remove lockwire and disconnect the HPC air valve supply and signal tubes (AA01/25) from the solenoid adapters at 1 o'clock position. See Figure 304 (Sheet 1).

(4) Remove lockwire and disconnect the two No. 3 bearing air cooler tubes (LP33/34) from the cooler at 2:30 o'clock position.

(5) Disconnect and remove the tubes from the IDG heat exchanger at 4 o'clock position as follows. See Figure 304 (Sheet 2).

  (a) Remove the lockwire and disconnect the airframe (IDG) cooler outlet oil tube nut. Remove the three bolts that attach the tube to the heat exchanger. Remove the tube and discard the packing. Install the protection covers to the tube ends and port.

  (b) Remove the lockwire and remove the (IDG) air/oil cooler valve hydraulic pressure and return tubes from the heat exchanger and the manifolds. Install the protective covers to the tubes, manifold tees, and the adapters.

(6) Remove the lockwire and disconnect the compressor stator cylinder hydraulic pressure (CP12) and return tube (CR03) from the manifolds and cylinder as follows. See Figure 304 (Sheet 3).

  (a) Remove the clamp bolts that attach the tubes to the Flange E bracket.

  (b) Remove the tubes and install the protective covers to the tubes, manifold tees, and adapters.

(7) Remove the hydraulic pressure (CP05) and oil cooler inlet return (CR01) manifolds as follows. See Figure 304 (Sheet 3).

(a) Remove the lockwire and disconnect the two hose nuts from the manifolds at 3 o'clock position.

(b) Remove the lockwire and disconnect the two manifolds at the lower tee connections at 5 o'clock position.

(c) Remove the clamp bolts and nut that attach the manifolds to the engine brackets. Remove the manifolds and install the protective covers to the hoses and to the manifold ends.

(8) Remove the fuel distribution valve supply tube (FM09) as follows. See Figure 304 (Sheet 4).

(a) Remove the lockwire and disconnect each end.

(b) Remove the clamp bolts and nuts that attach the tube to the engine.

(c) Remove the tube and discard the packings.

(d) Install the protective cover.

(9) Remove the three bleed valve supply tubes (AA26/27/29) as follows. See Figure 304 (Sheet 5).

(a) Remove the lockwire and disconnect the three tube connections at 2:30 o'clock position.

(b) Remove the lockwire and disconnect the two tube connections to the 5 o'clock position solenoid. Remove the lockwire and disconnect the tube connection at the maintenance break adjacent to the solenoid. Remove the lockwire and disconnect the tube nut from the tee adjacent to the solenoid.

(c) Remove the clamp bolts that attach the tubes to the engine brackets, to each other, and to the harness clamps.

(d) Remove the tubes from the engine. Install the protective covers to all the tube ends and the solenoid adapters.

(10) Remove the upper PT2.5 sensing tube assembly (AS30) as follows. See Figure 304 (Sheets 6, 7 and 8).

(a) For engines not equipped with the supplemental control unit (SCU) with multiplexing, remove the lockwire from the cap assembly. Remove the cap assembly from the tube.

(b) For engines equipped with the supplemental control unit (SCU) with multiplexing, remove the lockwire and disconnect the lower tube nut from the tube coupling tube (AS30) at approximately the 4 o'clock position rearward of Flange E.

(c) Remove the bolts, clamps and a nut that attach the (AS30) tube to brackets on Flange E at the 1, 1:30, 2:30, and 3:30 o'clock positions.

(d) Remove the tube from the engine and install protection covers.

(11) For engines equipped with the supplemental control unit (SCU) with multiplexing, remove the lower PT2.5 sensing tube assembly (AS35) as follows.

(a) Remove the bolts and clamps that attach the (AS35) tube to brackets on Flange E at the 4:30 and 5:00 o'clock positions.

(b) Remove the tube from the engine and install protection covers.

NOTE: The lower manifold (AS31) was previously removed with the EEC speed transducer (N1) multiplexer input probe.

(12) Remove the lockwire and disconnect the angle gearbox oil pressure tube (LP09) from the angle gearbox at 6 o'clock position. See Figure 304 (Sheet 9).

(13) Remove the two bolts that attach the angle gearbox oil scavenge tube (LR01) to the angle gearbox at 6 o'clock position. Loosen the clamp bolts as necessary to disengage the tube from the angle gearbox boss. Remove the packing. Install protective covers.

(14) Remove lockwire and disconnect the (2.5) bleed valve cylinder hydraulic pressure (CP02) and return (CR02) tubes from the cylinder and manifolds. See Figure 304 (Sheet 10). Remove the tubes. Install protective covers to the tubes, adapters, and manifold tees.

(15) Remove the two bolts and disconnect the cooling air manifold (AC34) from the fan case boss at 7 o'clock position. Remove the clamp bolt and tube.

(16) Remove the lockwire and disconnect the No. 1, 1.5 and 2 bearing oil scavenge tube (LR02) at 7:30 o'clock position. See Figure 304 (Sheet 11).

(17) Remove lockwire and disconnect each end of the (left) air/oil cooler hydraulic pressure (CP08) and return (CR08), tubes from the air/oil heat exchanger adapters at 8 o'clock position and manifolds. Remove the clamp bolt that attaches the pressure tube to the Flange E bracket. Remove the two tubes and install the protective closures.

(18) Remove the six bolts that attach the air/oil cooler inlet oil tube (LP02) to the main oil filter housing and the air/oil heat exchanger. See Figure 304 (Sheet 12). Remove the clamp bolt that attaches the tube to the HPC case bracket. Move the tube rearward and temporarily attach with lockwire. Discard the packings. Install the protection covers.

R CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH
R CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND
R INSTALL A TUBE WITH A FLEX SEGMENT WITH THE
R SAME PRECAUTION USED FOR A TUBE WITHOUT A
R FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A
R TUBE TO HELP WITH THE INSTALLATION OR REMOVAL
R OF THE TUBE OR AN ATTACHED COMPONENT. IF A
R FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE
R A KINK IN THE EXTERNAL WIRE BRAID AND IN THE
R INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND
R LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(19) Remove the two bolts that attach the air/oil cooler outlet hose and tube assembly (LP03) to the air/oil heat exchanger. Remove the lockwire and disconnect the tube nut from the fuel oil cooler bypass valve adapter. Remove the clamp bolts that attach the tube to the engine. Remove the tube and discard the packings. Install the protection covers.

ENGINE GENERAL - INTERMEDIATE CASE - REMOVAL-21

(20) Remove lockwire and disconnect the main bearing oil pressure tube (LP05) from the strainer housing at 9 o'clock position and the strainer housing at top of the fuel/oil cooler. See Figure 304 (Sheet 13). Remove the clamp bolts and remove the tube. Discard the packing and retainer. Remove the bolt and clamp that attaches the strainer housing to the Flange E bracket. Install protective covers.

(21) Remove lockwire and disconnect the two signal tubes (AA06/18) and the supply tube (AA22) from the solenoid adapters at 10 o'clock position.

(22) Remove lockwire and disconnect the main bearing breather tube (LB06) at 11:30 o'clock position. See Figure 304 (Sheet 14).

(23) Remove lockwire and disconnect the EEC PT4.95 tube (AS04) at 11:30 o'clock position.

(24) If removal of the HPC top front case is required per 72-00-35, Removal-18 (Task 72-00-35-030-001), after the engine is split, remove the (TCC) air valve actuator at 2 o'clock position as follows. See Figure 305.

  (a) Remove the nut and bolt that attach the cable rod end to the (HPC) TCC air shutoff valve idler arm.

  (b) Remove the lockwire and disconnect the cable coupling nut from the actuator.

  (c) Remove the bolt and ground strap from the actuator.

  (d) Remove the four bolts (and nuts, if equipped) that attach the actuator clamps to the bracket.

  (e) Lift the actuator and disengage the cable end from the actuator. Remove the actuator.

  NOTE: Do not remove the hoses from the actuator.

(25) If removal of the HPC top front case is necessary per 72-00-35, Removal-18 (Task 72-00-35-030-001), after the engine is split, remove the stator vane actuator and support assembly as follows. See Figure 306.

(a) Remove the bolts that attach the fuel flowmeter support bracket to the support assembly. Remove the bracket.

(b) Remove the cotter pins, nuts, washers, and bolts that attach the four rod ends to the synchronizing rings. Disengage the rod ends. Install lockwire to the rod end bearings to attach them to the rod ends.

(c) Remove the cotter pins, nuts, bolts, studs, spacers, and shims that attach the support assembly to the HPC cases and brackets.

(d) Remove the stator vane actuator and support assembly.

E. Separate The Fan Unit From The Core Engine

(1) Disconnect the gearbox driveshaft and the gearbox−drive−shaft−(front)−housing (called front housing) from the angle gearbox as follows. See Figure 307.

(a) Remove the four bolts that attach the brackets on the gearbox−driveshaft−(front)−housing (called front housing) to the HPC.

CAUTION: DO NOT USE A TOOL SUCH AS A SCREWDRIVER TO MOVE THE FRONT HOUSING AWAY FROM THE ANGLE GEARBOX. SUCH TOOLS CAN DAMAGE THE PARTS.

(b) Remove the bolts, nuts, and washers that attach the front housing and brackets to the angle gearbox.

(c) Carefully pull the front housing to the rear.

(d) Remove the retaining ring from the gearbox driveshaft.

(e) Carefully pull the gearbox driveshaft to the rear.

(f) Discard the packing at the front of the front housing.

(2) Install PWA 85585 Guide Ring on the No. 1.5 bearing support assembly as follows. See Figure 308.

(a) Install PWA 85585 Guide Ring to the No. 1.5 bearing support assembly.

(b) Attach the ring with the detail screws.

(3) Install either PWA 88204 Guide to the front of the LPT shaft. Tighten by hand.

CAUTION: DO NOT SUPPORT THE FRONT OF THE CORE−UNIT BY THE GUIDE THAT YOU INSTALL ON THE FRONT OF THE CORE−UNIT. DO NOT PUT ANY FORCE OR STRESS ON THE GUIDE. TOO MUCH STRESS ON THE GUIDE CAN CAUSE DAMAGE TO THE PLAIN ROUND NUT.

(4) Install PWA 85631 Guide as follows.

(a) With the PWA 88204 Guide to support the front of the LPT shaft, install the Guide (PWA 85631) in the plain round nut. Be sure the threads engage correctly.

(b) Use PWA 85471 Wrench and tighten the Guide (PWA 85631) until seated.

NOTE: If equipped, the four grooves on the PWA 85631 Guide, Change B) must be fully rearward of the PWA 85585 Guide Ring front surface. If the grooves are not fully rearward of the ring, the threads of the guide are not fully engaged.

(5) Move the legs of PWA 85785 Adapter to their outermost position. Install PWA 85785 Adapter over the previously installed guide until seated against the fan hub. Turn the legs outward and engage the rear of the hub. Tighten the detail wing nuts to hold the legs in position.

(6) Install two PWA 86567 Adapters on the fan case at 3 and 9 o'clock. See Figure 309.

(7) Attach PWA 85623 Eye to the intermediate case at 12 o'clock.

(8) Install PWA 85390 Lifting Adapter on the 8th stage bleed pads as follows.

(a) Remove the tool's two adapters. To remove the adapters, remove the pins.

R
R

(b) Attach the adapters to the 8th stage bleed pads with the detail screws.

(c) With a hoist, lift the arms of the tool.

(d) Attach the arms to the adapters with the pins.

(9) Support the engine with hoists at:

(a) The front of the fan unit. Use, in addition to a hoist and PWA 86567 Adapters, PWA 76155 Sling and two PWA 76154 Adapters.

(b) The rear of the fan unit: PWA 85623 Eye.

(c) The middle of the core engine: PWA 85390 Adapter.

(10) Remove the pedestals.

(11) Remove the 33 bolts in the rear flange of the No. 1.5-bearing-support-assembly. See Figure 310.

NOTE: If removal of the HPC top front case is necessary per 72-00-35, Removal-18 (Task 72-00-35-030-001), use the PWA 86598 Retainer or PWA 86209 Retainer as an alternative to PWA 85537 Fixture. This retainer will permit removal of the top case.

CAUTION: FOR RETAINING BOLTS USE WORKBOLTS WITH DRILLED HEADS WITH A 0.500 INCH (12.700 mm) MAXIMUM SHANK AND THREAD LENGTH. (PN MS9218-05 OR PN MS9218-06 IS RECOMMENDED).

(12) Install four retaining bolts in the holes indicated in Figure 310. Tighten by hand. Tag the bolts "To Be Removed".

(13) Install four jacking bolts in the rear flange of the No. 1.5 bearing support assembly. Tighten by hand. See Figure 310. Tag the bolts "Jacking Bolts".

(14) Remove the Flange E hardware as follows. Refer to 72-00-34, Removal-20 (Task 72-00-34-020-020).

(15) Install two PWA 85260 Guide Pins at approximately 3 and 9 o'clock positions on Flange E. Install two PWA 29855-7 Aligning Pins at approximately 6 and 12 o'clock positions on Flange E. See Figure 311 and Figure 312.

(a) For engines with the 2.5 bleed actuator support bracket (Post SB PW4ENG 75-84), remove the three bolts and nuts that attach the support bracket to a bracket on Flange E.

(16) Install six PWA 101848 Jackscrew Plates as follows. See Figure 312.

(a) Remove the two detail screws from one of the plates.

(b) Put the plate in the space between the intermediate case and the bosses of the HPC-inlet-synchronizing-ring-assemblies. Align the screw holes in the plate with the inserts in the intermediate case.

(c) Attach the plate to the intermediate case with the two screws.

(d) Install the five other jackscrew plates in the same way. Make sure that the distances between the plates are equal.

CAUTION: BE SURE THAT THE HOISTS HAVE THE CORRECT EQUAL TENSION TO PERMIT THE SEPARATION OF THE FAN UNIT FROM THE CORE ENGINE. TOO MUCH OR TOO LESS TENSION ON ANY OF THE HOISTS CAN CAUSE DAMAGE TO THE ENGINE.

CAUTION: USE A FLASHLIGHT AND BE SURE THAT ALL 33 SUPPORT BOLTS AND ALL 74 FLANGE E BOLTS ARE REMOVED. COUNT THE BOLTS. BE SURE ALL EXTERNAL PARTS ARE DISCONNECTED AND ARE CLEAR FOR SEPARATION.

(17) Move the fan unit away from the core engine.

(a) Use the jackscrews in the No. 1.5 bearing support assembly and the jackscrew plates.

(18) For engines that have incorporated SB PW4ENG 72-48, discard the packing on the intermediate case at Flange E. Remove the transfer tube (and packings, if equipped).

(19) Remove the four bolts that are in the No. 1.5 bearing support assembly with the tag "Jacking Bolts".

R
R

(20) Remove the two PWA 85260 Guide Pins and the two PWA 29855−7 Aligning Pins from Flange E.

CAUTION: DO NOT SUPPORT THE FRONT OF THE CORE−UNIT BY THE PWA 85631 GUIDE THAT IS INSTALLED ON THE FRONT OF THE CORE−UNIT. DO NOT PUT ANY FORCE OR STRESS ON THE GUIDE. TOO MUCH STRESS ON THE GUIDE CAN CAUSE DAMAGE TO THE PLAIN ROUND NUT.

(21) Remove the PWA 88204 Guide from the front of the core−unit. Install the flat washer and the turbine shaft nut to the front of the LPT shaft. Tighten the nut with PWA 85429 Wrench until it is seated against the washer. See Figure 313.

(22) Install PWA 85537 Fixture (optional to the installation of PWA 86598 or PWA 86209 Retainer) on the HPC. See Figure 314.

(a) The No. 2−bearing−support−assembly has a locating pin at 6:00 o'clock. Put the locating pin in one of the holes of the tool's inner bolt circle.

(b) Attach the tool to the HPC with the detail screws, washers, and nuts.

(c) Attach the tool to the No. 2−bearing−support−assembly with the detail screws.

(23) Install PWA 86598 Retainer or PWA 86209 Retainer (optional to PWA 85537 Fixture) on the HPC. Use the detail bolts and nuts. See Figure 314.

CAUTION: DO NOT SUPPORT THE FRONT OF THE CORE−UNIT BY THE GUIDE THAT IS INSTALLED ON THE FRONT OF THE CORE−UNIT. DO NOT PUT ANY FORCE OR STRESS ON THE GUIDE. TOO MUCH STRESS ON THE GUIDE CAN CAUSE DAMAGE TO THE PLAIN ROUND NUT.

(24) Attach pedestals to PWA 85537 Fixture or PWA 86598 Retainer or PWA 86209 Retainer.

(25) Remove the gearbox driveshaft and front housing from the gearbox driveshaft housing (called rear housing) as follows. See Figure 315.

(a) Carefully pull the gearbox driveshaft out of the front housing.

(b) Carefully pull the front housing out of the rear housing. Discard the packing.

(c) Put them on pallets. Install protective covers.

(26) Remove PWA 101848 Jackscrew Plates.

NOTE: Do not remove PWA 85390 Adapter from the core−unit.

(27) Remove the PWA 85785 Adapter from the front fan hub.

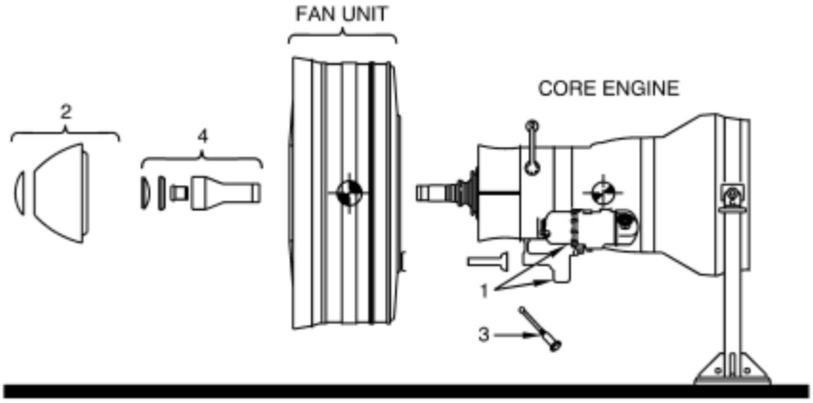
(28) To trunnion the fan unit to rear end down, refer to 72−00−00, Special Procedures−21 (Task 72−00−00−020−004). If you do not trunnion the fan unit, do as follows:

(a) Attach PWA 25926 Adapters to four PWA 25757 Pedestals. Put the PWA 86567 Adapters that are on the fan case and the brackets that are on the intermediate case in the adapters on the pedestals.

(b) Remove the PWA 76154 Adapters, sling, eye, and hoists from the fan unit.

F. Postrequisites

(1) If necessary, remove the HPC top front case. See 72−00−35, Removal−18 (Task 72−00−35−030−001).



1. MAGNETIC PLUG ASSEMBLIES IN THE OIL TANK AND MAIN GEARBOX
2. COMPRESSOR INLET CONE
3. NI SPEED TRANSDUCER
4. LPC/LPT COUPLING

(Task 72-00-34-020-004)

Task 72−00−34−020−006:

1. Remove The Fan Unit From The Core Engine

A. Prerequisites

(1) Transfer the engine from the transport stand to pedestals. Refer to 72−00−00, Special Procedures−01 (Task 72−00−00−010−001).

(2) Refer to Table 301 for the other procedures that are prerequisite to this procedure. See Figure 301.

Step	Remove The	Chapter	Removal
1	Magnetic Chip Detector Assemblies In The Oil Tank And Main Gearbox	72−00−61	36 (Task 72−00−61−050−017)
2	Compressor Inlet Cone	72−00−31	02 (Task 72−00−31−020−001)
3a	Electronic Engine Control (EEC) Speed Transducer (N1)	72−00−34	03 (Task 72−00−34−050−001)
or			
3b	EEC Speed Transducer (N1) Multiplexer or SCU Input Speed Probe	72−00−34	17 (Task 72−00−34−050−014)
4	LPC/LPT Coupling*	72−00−32	01 (Task 72−00−32−020−001)

NOTE: *Do not remove the Stage 1 LPC blade assemblies

Other Prerequisite Procedures
Table 301

B. Equipment And Materials Necessary

ENGINE GENERAL - INTERMEDIATE CASE - REMOVAL-21

Special Tools:

PWA 25757	Pedestal (4 Necessary)
PWA 25926	Adapters (4 Necessary)
PWA 29855-7	Aligning Pin (2 Necessary)
PWA 76154	Adapter (2 Necessary)
PWA 76155	Sling
PWA 85260	Guide Pin (2 Necessary)
PWA 85390	Adapter, Lifting
PWA 85429	Wrench
PWA 85471	Wrench, Torque
PWA 85537	Fixture, Handling (For Compressors With A Symmetric Case)
PWA 85585	Ring, Guide
PWA 85623	Eye, Lifting
PWA 85631	Guide, Piloting
PWA 85749	Adapter, Torque-Electrical Connector
PWA 85785	Adapter, Piloting
PWA 86209	Retainer, Positioning (Optional To PWA 85537)
PWA 86567	Adapter, Lift And Trunnion (2 Necessary)
PWA 86598	Retainer, Positioning (Optional To PWA 86209)
PWA 88204	Guide, Piloting
PWA 88560	Fixture, Handling (For Compressors With An Asymmetric Case)
PWA 101848	Puller, Jackscrew (6 Necessary)

NOTE: Use PWA 86598 or PWA 86209 Retainer as an alternative to PWA 85537 Fixture if you will remove the HPC top front case with the procedure in 72-00-35, Removal-18 Task 72-00-35-030-001.

C. Disconnect The EEC Wiring Harnesses As Follows: See Figure 302.

(1) Disconnect the W1 EEC wiring harness as follows.

(a) Use the PWA 85749 Torque Adapter and disconnect the W1P11 and the W1P10 harness connectors from the 1 o'clock position solenoid.

(b) Remove the clamp bolts and nuts that attach the harness to the Flange E bracket and to the solenoid muscle tube.

(c) Disconnect the W1P25 harness connector at the HPC case bracket at 1 o'clock position.

(d) Disconnect the W1P24 harness connector at the HPC case bracket at 10 o'clock position.

(e) Disconnect the W1P9 harness connector at the HPC case bracket at 11 o'clock position.

(f) Remove all the clamp bolts and nuts that attach the W1 harness to the HPC case brackets.

(g) Temporarily attach the W1 harness to the 12 o'clock strut with lockwire. Keep the harness clear of Flange E.

(h) Install protection covers.

(2) Disconnect the W2 EEC wiring harness.

(a) Disconnect the W2P26 harness connector at the HPC case bracket at 12 o'clock position.

(b) Remove the bolt that attaches the retaining bracket and the W2J9 receptacle to the HPC case bracket at 11 o'clock position.

(c) Remove all the clamp bolts that attach the W2 harness to the Flange E bracket and the No. 1, 1.5, and 2 bearing tubes.

(d) Temporarily attach the W2 harness to the 12 o'clock strut with lockwire. Keep the harness clear of Flange E.

(e) Install protection covers.

(3) Remove the two bolts that attach the IDG−heat−exchangervalve harness and retaining bracket to the HPC case bracket. Remove the retaining bracket and disconnect the harness receptacle. Install a protection cover. Remove the two clamp bolts that attach the IDG harness to the hydraulic tube.

(4) Use the Torque Adapter (PWA 85749) and disconnect the W4P4 and the W5P11 harness connectors from the 5 o'clock position solenoid. Install protection covers.

(5) Remove the clamp bolt that attaches the W4 harness (to the EEC speed transducer) to the bleed valve supply tube at 5 o'clock position.

(6) Disconnect the W3P15 harness connector from the 2.5 bleed valve actuator at 7 o'clock position. Install protection covers.

(7) Disconnect the W3P17 connector from the (engine) air/oil heat exchanger harness receptacle at 7:30 o'clock position. Remove the two bolts that attach the retaining bracket and receptacle from the HPC case bracket. Install a protection cover on the receptacle.

(8) If removal of the HPC top front case is necessary by 72−00−35, Removal−18 (Task 72−00−35−030−001), after the engine is split, disassemble the W3, W4, and W5 harnesses from the HPC top front case as follows. See Figure 303.

  (a) Remove the bolts, nuts, and spacers that attach the harness clamps to the HPC top front case brackets from 9 o'clock position to 3 o'clock position.

  (b) Remove the bolts, nuts, and spacers that attach the harness clamps to the two bracket assemblies above and over the stator vane actuator support.

  (c) Remove the bolts and brackets that attach the W4J25 connector, the W5J26 connector, and the W3J24 connector to the HPC case brackets at 1, 12 and 10 o'clock position respectively.

  (d) Remove the bolts and nuts that attach the harness clamps to the fuel/oil cooler brackets and to the bracket assembly above the cooler.

  (e) Disconnect the W4P16 connector from the TCC air valve actuator.

  (f) Disconnect the W5P7 connector and the W4P3 connector from the stator vane actuator.

  (g) Remove the bolts and nuts that attach the harness to the bottom of the stator vane actuator support.

  (h) Remove the harness bracket assemblies from over the TCC air valve actuator and from over the stator vane actuator support assembly.

(i) Move the harnesses rearward of Flange H and install protection covers to all connectors and receptacles.

D. Disconnect The Tubes As Follows
See Figure 304.

(1) Remove the lockwire and disconnect the EEC PB sensing tubes (AS09/20) at 12:30 o'clock position. See Figure 304 (Sheet 1).

(2) For engines with PMUX or SCU, remove lockwire and disconnect the PT2.5 sensing tubes (AS29/30) at 12:30 o'clock position. See Figure 304 (Sheet 1).

(3) Remove lockwire and disconnect the HPC air valve supply and signal tubes (AA01/25) from the solenoid adapters at 1 o'clock position. See Figure 304 (Sheet 1).

(4) Remove lockwire and disconnect the two No. 3 bearing air cooler tubes (LP33/34) from the cooler at 2:30 o'clock position.

(5) Disconnect and remove the tubes from the IDG heat exchanger at 4 o'clock position as follows. See Figure 304 (Sheet 2).

(a) Remove the lockwire and disconnect the airframe (IDG) cooler outlet oil tube nut. Remove the three bolts that attach the tube to the heat exchanger. Remove the tube and discard the packing. Install the protection covers to the tube ends and port.

(b) Remove the lockwire and remove the (IDG) air/oil cooler valve hydraulic pressure and return tubes from the heat exchanger and the manifolds. Install the protective covers to the tubes, manifold tees, and the adapters.

(6) Remove the lockwire and disconnect the compressor stator cylinder hydraulic pressure (CP12) and return tube (CR03) from the manifolds and cylinder as follows. See Figure 304 (Sheet 3).

(a) Remove the clamp bolts that attach the tubes to the Flange E bracket.

(b) Remove the tubes and install the protective covers to the tubes, manifold tees, and adapters.

(7) Remove the hydraulic pressure (CP05) and oil cooler inlet return (CR01) manifolds as follows. See Figure 304 (Sheet 3).

(a) Remove the lockwire and disconnect the two hose nuts from the manifolds at 3 o'clock position.

(b) Remove the lockwire and disconnect the two manifolds at the lower tee connections at 5 o'clock position.

(c) Remove the clamp bolts and nut that attach the manifolds to the engine brackets. Remove the manifolds and install the protective covers to the hoses and to the manifold ends.

(8) Remove the fuel distribution valve supply tube (FM09) as follows. See Figure 304 (Sheet 4).

(a) Remove the lockwire and disconnect each end.

(b) Remove the clamp bolts and nuts that attach the tube to the engine.

(c) Remove the tube and discard the packings.

(d) Install the protective cover.

(9) Remove the three bleed valve supply tubes (AA26/27/29) as follows. See Figure 304 (Sheet 5).

(a) Remove the lockwire and disconnect the three tube connections at 2:30 o'clock position.

(b) Remove the lockwire and disconnect the two tube connections to the 5 o'clock position solenoid. Remove the lockwire and disconnect the tube connection at the maintenance break adjacent to the solenoid. Remove the lockwire and disconnect the tube nut from the tee adjacent to the solenoid.

(c) Remove the clamp bolts that attach the tubes to the engine brackets, to each other, and to the harness clamps.

(d) Remove the tubes from the engine. Install the protective covers to all the tube ends and the solenoid adapters.

(10) Remove the upper PT2.5 sensing tube assembly (AS30) as follows. See Figure 304 (Sheet 6), Figure 304 (Sheet 7) and Figure 304 (Sheet 8).

(a) For engines not equipped with the supplemental control unit (SCU) with multiplexing, remove the lockwire from the cap assembly. Remove the cap assembly from the tube.

(b) For engines equipped with the supplemental control unit (SCU) with multiplexing, remove the lockwire and disconnect the lower tube nut from the tube coupling tube (AS30) at approximately the 4 o'clock position rearward of Flange E.

(c) Remove the bolts, clamps and a nut that attach the (AS30) tube to brackets on Flange E at the 1, 1:30, 2:30, and 3:30 o'clock positions.

(d) Remove the tube from the engine and install protection covers.

(11) For engines equipped with the supplemental control unit (SCU) with multiplexing, remove the lower PT2.5 sensing tube assembly (AS35) as follows.

(a) Remove the bolts and clamps that attach the (AS35) tube to brackets on Flange E at the 4:30 and 5:00 o'clock positions.

(b) Remove the tube from the engine and install protection covers.

NOTE: The lower manifold (AS31) was previously removed with the EEC speed transducer (N1) multiplexer input probe.

(12) Remove the lockwire and disconnect the angle gearbox oil pressure tube (LP09) from the angle gearbox at 6 o'clock position. See Figure 304 (Sheet 9).

(13) Remove the two bolts that attach the angle gearbox oil scavenge tube (LR01) to the angle gearbox at 6 o'clock position. Loosen the clamp bolts as necessary to disengage the tube from the angle gearbox boss. Remove the packing. Install protective covers.

(14) Remove lockwire and disconnect the (2.5) bleed valve cylinder hydraulic pressure (CP02) and return (CR02) tubes from the cylinder and manifolds. See Figure 304 (Sheet 10). Remove the tubes. Install protective covers to the tubes, adapters, and manifold tees.

(15) Remove the two bolts and disconnect the cooling air manifold (AC34) from the fan case boss at 7 o'clock position. Remove the clamp bolt and tube.

(16) Remove the lockwire and disconnect the No. 1, 1.5 and 2 bearing oil scavenge tube (LR02) at 7:30 o'clock position. See Figure 304 (Sheet 11).

(17) Remove lockwire and disconnect each end of the (left) air/oil cooler hydraulic pressure (CP08) and return (CR08), tubes from the air/oil heat exchanger adapters at 8 o'clock position and manifolds. Remove the clamp bolt that attaches the pressure tube to the Flange E bracket. Remove the two tubes and install the protective closures.

(18) Remove the six bolts that attach the air/oil cooler inlet oil tube (LP02) to the main oil filter housing and the air/oil heat exchanger. See Figure 304 (Sheet 12). Remove the clamp bolt that attaches the tube to the HPC case bracket. Move the tube rearward and temporarily attach with lockwire. Discard the packings. Install the protection covers.

R CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH
R CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND
R INSTALL A TUBE WITH A FLEX SEGMENT WITH THE
R SAME PRECAUTION USED FOR A TUBE WITHOUT A
R FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A
R TUBE TO HELP WITH THE INSTALLATION OR REMOVAL
R OF THE TUBE OR AN ATTACHED COMPONENT. IF A
R FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE
R A KINK IN THE EXTERNAL WIRE BRAID AND IN THE

R INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND
R LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(19) Remove the two bolts that attach the air/oil cooler outlet hose and tube assembly (LP03) to the air/oil heat exchanger. Remove the lockwire and disconnect the tube nut from the fuel oil cooler bypass valve adapter. Remove the clamp bolts that attach the tube to the engine. Remove the tube and discard the packings. Install the protection covers.

(20) Remove lockwire and disconnect the main bearing oil pressure tube (LP05) from the strainer housing at 9 o'clock position and the strainer housing at top of the fuel/oil cooler. See Figure 304 (Sheet 13). Remove the clamp bolts and remove the tube. Discard the packing and retainer. Remove the bolt and clamp that attaches the strainer housing to the Flange E bracket. Install protective covers.

(21) Remove lockwire and disconnect the two signal tubes (AA06/18) and the supply tube (AA22) from the solenoid adapters at 10 o'clock position.

(22) Remove lockwire and disconnect the main bearing breather tube (LB06) at 11:30 o'clock position. See Figure 304 (Sheet 14).

(23) Remove lockwire and disconnect the EEC PT4.95 tube (AS04) at 11:30 o'clock position.

(24) If removal of the HPC top front case is necessary by 72−00−35, Removal−18 (Task 72−00−35−030−001), after the engine is split, remove the (TCC) air valve actuator at 2 o'clock position as follows. See Figure 305.

(a) Remove the nut and bolt that attach the cable rod end to the (HPC) TCC air shutoff valve idler arm.

(b) Remove the lockwire and disconnect the cable coupling nut from the actuator.

(c) Remove the bolt and ground strap from the actuator.

(d) Remove the four bolts (and nuts, if equipped) that attach the actuator clamps to the bracket.

(e) Lift the actuator and disengage the cable end from the actuator. Remove the actuator.

NOTE: Do not remove the hoses from the actuator.

(25) If removal of the HPC top front case is necessary by 72−00−35, Removal−18 (Task 72−00−35−030−001), after the engine is split, remove the stator vane actuator and support assembly as follows. See Figure 306.

(a) Remove the bolts that attach the fuel flowmeter support bracket to the support assembly. Remove the bracket.

(b) Remove the cotter pins, nuts, washers, and bolts that attach the four rod ends to the synchronizing rings. Disengage the rod ends. Install lockwire to the rod end bearings to attach them to the rod ends.

(c) Remove the cotter pins, nuts, bolts, studs, spacers, and shims that attach the support assembly to the HPC cases and brackets.

(d) Remove the stator vane actuator and support assembly.

E. Separate The Fan Unit From The Core Engine

(1) Disconnect the gearbox driveshaft and the gearboxdriveshaft(front)housing (called front housing) from the angle gearbox as follows. See Figure 307.

(a) Remove the four bolts that attach the brackets on the gearbox−driveshaft−(front)−housing (called front housing) to the HPC.

CAUTION: DO NOT USE A TOOL SUCH AS A SCREWDRIVER TO MOVE THE FRONT HOUSING AWAY FROM THE ANGLE GEARBOX. SUCH TOOLS CAN DAMAGE THE PARTS.

(b) Remove the bolts, nuts, and washers that attach the front housing and brackets to the angle gearbox.

(c) Carefully pull the front housing to the rear.

(d) Remove the retaining ring from the gearbox driveshaft.

(e) Carefully pull the gearbox driveshaft to the rear.

(f) Discard the packing at the front of the front housing.

(2) Install PWA 85585 Guide Ring on the No. 1.5 bearing support assembly as follows. See Figure 308.

(a) Install Guide Ring (PWA 85585) to the No. 1.5 bearing support assembly.

(b) Attach the ring with the detail screws.

(3) Install the PWA 88204 Guide to the front of the LPT shaft. Tighten by hand.

CAUTION: DO NOT SUPPORT THE FRONT OF THE CORE−UNIT BY THE GUIDE THAT YOU INSTALL ON THE FRONT OF THE CORE−UNIT. DO NOT PUT ANY FORCE OR STRESS ON THE GUIDE. TOO MUCH STRESS ON THE GUIDE CAN CAUSE DAMAGE TO THE PLAIN ROUND NUT.

(4) Install PWA 85631 Guide as follows.

(a) With the Guide (PWA 88204) to support the front of the LPT shaft, install the Guide (PWA 85631) in the plain round nut. Be sure the threads engage correctly.

(b) Use PWA 85471 Wrench and tighten the Guide (PWA 85631) until seated.

NOTE: If equipped, the four grooves on the Guide (PWA 85631), (Change B) must be fully rearward of the Guide Ring (PWA 85585) front surface. If the grooves are not fully rearward of the ring, the threads of the guide are not fully engaged.

(5) Move the legs of PWA 85785 Adapter to their outermost position. Install PWA 85785 Adapter over the previously installed guide until seated against the fan hub. Turn the legs outward and engage the rear of the hub. Tighten the detail wing nuts to hold the legs in position.

ENGINE GENERAL − INTERMEDIATE CASE − REMOVAL−21

(6) Install two PWA 86567 Adapters on the fan case at 3 and 9 o'clock. See Figure 309.

(7) Attach PWA 85623 Eye to the intermediate case at 12 o'clock.

(8) Install PWA 85390 Lifting Adapter on the 8th stage bleed pads as follows.

(a) Remove the tool's two adapters. To remove the adapters, remove the pins.

(b) Attach the adapters to the 8th stage bleed pads with the detail screws.

(c) With a hoist, lift the arms of the tool.

(d) Attach the arms to the adapters with the pins.

(9) Support the engine with hoists at:

(a) The front of the fan unit. Use, in addition to a hoist and Adapters (PWA 86567), PWA 76155 Sling and two PWA 76154 Adapters.

(b) The rear of the fan unit: Eye (PWA 85623).

(c) The middle of the core engine: Adapter (PWA 85390).

(10) Remove the pedestals.

(11) Remove the 33 bolts in the rear flange of the No. 1.5 bearing−support−assembly. See Figure 310.

NOTE: If removal of the HPC top front case is necessary per 72−00−35, Removal−18 (Task 72−00−35−030−001), use the Retainer (PWA 86598) or (PWA 86209) as an alternative to Fixture (PWA 85537). This retainer will permit removal of the top case.

R
R

ENGINE GENERAL − INTERMEDIATE CASE − REMOVAL−21

CAUTION: FOR RETAINING BOLTS USE WORKBOLTS WITH DRILLED HEADS WITH A 0.500 INCH (12.700 mm) MAXIMUM SHANK AND THREAD LENGTH. (PN MS9218−05 OR PN MS9218−06 IS RECOMMENDED).

(12) Install four retaining bolts in the holes indicated in Figure 310. Tighten by hand. Tag the bolts "To Be Removed".

(13) Install four jacking bolts in the rear flange of the No. 1.5 bearing support assembly. Tighten by hand. See Figure 310. Tag the bolts "Jacking Bolts".

(14) Remove the bolts that attach the HPC to the intermediate case at Flange E. Install two PWA 85260 Guide Pins at approximately 3 and 9 o'clock positions on Flange E. Install two PWA 29855−7 Aligning Pins at approximately 6 and 12 o'clock positions on Flange E. See Figures 311 and 312.

NOTE: Flange E has two configurations, the UPS configuration has 72 bolts and the other configuration has 74 bolts.

(a) For engines with the 2.5 bleed actuator support bracket (Post SB PW4ENG 75−84), remove the three bolts and nuts that attach the support bracket to a bracket on Flange E.

(15) Install six PWA 101848 Jackscrew Plates as follows. See Figure 312.

(a) Remove the two detail screws from one of the plates.

(b) Put the plate in the space between the intermediate case and the bosses of the HPC−inlet−synchronizing ring assemblies. Align the screw holes in the plate with the inserts in the intermediate case.

(c) Attach the plate to the intermediate case with the two screws.

(d) Install the five other jackscrew plates in the same way. Make sure that the distances between the plates are equal.

R
R

CAUTION: BE SURE THAT THE HOISTS HAVE THE CORRECT EQUAL TENSION TO PERMIT THE SEPARATION OF THE FANUNIT FROM THE CORE ENGINE. TOO MUCH OR TOO LESS TENSION ON ANY OF THE HOISTS CAN CAUSE DAMAGE TO THE ENGINE.

CAUTION: USE A FLASHLIGHT AND BE SURE THAT ALL 33 SUPPORT BOLTS AND ALL THE FLANGE E BOLTS ARE REMOVED. COUNT THE BOLTS. THERE SHOULD BE 72 BOLTS FOR THE UPS CONFIGURATION AND 74 BOLTS FOR THE OTHER CONFIGURATION. BE SURE ALL EXTERNAL PARTS ARE DISCONNECTED AND ARE CLEAR FOR SEPARATION.

(16) Move the fan unit away from the core engine.

(a) Use the jackscrews in the No. 1.5 bearing support assembly and the jackscrew plates.

(17) For engines that have incorporated SB PW4ENG 72-48, discard the packing on the intermediate case at Flange E. Remove the transfer tube (and packings, if equipped).

(18) Remove the four bolts that are in the No. 1.5 bearing support assembly with the tag "Jacking Bolts".

(19) Remove the two Guide Pins (PWA 85260) and the two Aligning Pins (PWA 29855-7) from Flange E.

CAUTION: DO NOT SUPPORT THE FRONT OF THE CORE-UNIT BY THE GUIDE (PWA 85631) THAT IS INSTALLED ON THE FRONT OF THE CORE-UNIT. DO NOT PUT ANY FORCE OR STRESS ON THE GUIDE. TOO MUCH STRESS ON THE GUIDE CAN CAUSE DAMAGE TO THE PLAIN ROUND NUT.

(20) Remove the Guide (PWA 88204) from the front of the core-unit. Install the flat washer and the turbine shaft nut to the front of the LPT shaft. Tighten the nut with PWA 85429 Wrench until it is seated against the washer. See Figure 313.

(21) Install the, PWA 85537 Fixture (for compressors with the symmetric case), or the PWA 88560 Fixture (for compressors with the asymmetric case) (optional to the installation of Retainer (PWA 86598) or (PWA 86209) on the HPC. See Figure 314.

R
R

(a) The No. 2-bearing-support-assembly has a locating pin at 6:00 o'clock. Put the locating pin in one of the holes of the tool's inner bolt circle.

(b) Attach the tool to the HPC with the detail screws, washers, and nuts.

(c) Attach the tool to the No.2-bearing-support assembly with the detail screws.

(22) Install Retainer (PWA 86598) or (PWA 86209) (optional to Fixture (PWA 85537 or PWA 88560) on the HPC. Use the detail bolts and nuts. See Figure 314.

CAUTION: DO NOT SUPPORT THE FRONT OF THE CORE-UNIT BY THE GUIDE THAT IS INSTALLED ON THE FRONT OF THE CORE-UNIT. DO NOT PUT ANY FORCE OR STRESS ON THE GUIDE. TOO MUCH STRESS ON THE GUIDE CAN CAUSE DAMAGE TO THE PLAIN ROUND NUT.

(23) Attach pedestals to Fixture (PWA 85537) or Retainer (PWA 86598) or (PWA 86209).

(24) Remove the gearbox driveshaft and front housing from the gearbox driveshaft housing (called rear housing) as follows. See Figure 315.

(a) Carefully pull the gearbox driveshaft out of the front housing.

(b) Carefully pull the front housing out of the rear housing. Discard the packing.

(c) Put them on pallets. Install protective covers.

(25) Remove Jackscrew Plates (PWA 101848).

NOTE: Do not remove Adapter (PWA 85390) from the core-unit.

(26) Remove the Adapter (PWA 85785) from the front fan hub.

(27) To trunnion the fan unit to rear end down, refer to 72-00-00, Special Procedures-21 (Task 72-00-00-020-004). If you do not trunnion the fan unit, do as follows:

R
R

(a) Attach PWA 25926 Adapters to four PWA 25757 Pedestals. Put the Adapters (PWA 86567) that are on the fan case and the brackets that are on the intermediate case in the adapters on the pedestals.

(b) Remove the Adapters (PWA 76154), sling, eye, and hoists from the fan unit.

F. Postrequisites

(1) If necessary, remove the HPC top front case. See 72−00−35, Removal−18 (Task 72−00−35−030−001).

ENGINE GENERAL - INTERMEDIATE CASE - REMOVAL-22

Task 72-00-34-040-001:

1. Remove The No. 1 Bearing Vibration Transducer
   A. Prerequisites
      (1) Remove the No. 1 bearing support (front and rear) assembly. Refer to Removal-04 (Task 72-00-34-050-002).
   B. Equipment And Materials Required - None
   C. Procedure
      See Figures 301 through 303.
      (1) (Pre SB PW4ENG 77-13) Remove the transducer as follows:
         (a) Remove the two bolts and nuts that attach the transducer bracket to the start/stability-bleed-valve-solenoid bracket.
         (b) Remove the lockwire from the screws that attach the connector to its bracket. Remove the screws. Remove the connector from the bracket.
         (c) Disassemble and remove the connector from the cable Cover the transducer wires and pins with a sheet of plastic. Safety the plastic sheet with tape.

            NOTE: The tape and plastic must be installed around the pins and wire to make the cable move easily through the conduit. There must be sufficient plastic to prevent contamination of the wires and pins from the tape.

         (d) Pull the transducer out of the conduits. Discard the packing on the transducer.
         (e) Pull the front conduit out of the rear conduit. Discard the packing on the front conduit.
         (f) Keep the connector with the cable.
      (2) (Post SB PW4ENG 77-13) Remove the transducer as follows:
         (a) For aircraft that are not electrically equipped with the transducer, but the engines are equipped with the transducer, remove the electrical cap from the connector.
         (b) (Pre SB PW4ENG 77-17) Remove the two bolts that attach the transducer bracket to the boss on the gearbox driveshaft housing assembly.
         (c) (Post SB PW4ENG 77-17) Remove the (LP09) tube nut lockwire from the transducer bracket and remove the two bolts that attach the transducer bracket to the boss on the gearbox driveshaft housing assembly.
         (d) Remove the lockwire from the screws that attach the connector to its bracket. Remove the screws. Remove the connector from the bracket.

(e) Disassemble and remove the connector from the cable Cover the transducer wires and pins with a sheet of plastic. Safety the plastic sheet with tape.

NOTE: The tape and plastic must be installed around the pins and wire to make the cable move easily through the conduit. There must be sufficient plastic to prevent contamination of the wires and pins from the tape.

(f) Remove the bolt that attaches the transducer clamp to the bracket on the N1 speed transducer at 4:30 o'clock. Remove the clamp from the transducer cable.
(g) Pull the transducer out of the conduits. Discard the packing on the transducer.
(h) Pull the front conduit out of the rear conduit. Discard the packing on the front conduit.
(i) Keep the connector with the cable.

ENGINE GENERAL - INTERMEDIATE CASE - REMOVAL-23

Task 72-00-34-050-020:

1. Remove EEC Wiring Harness - W5 (Core Engine)

A. General

(1) To remove the EEC wiring harness - W3, see Removal-18 (Task 72-00-34-050-018).

(2) To remove the EEC wiring harness - W4, see Removal-19 (Task 72-00-34-050-019).

B. Equipment And Materials Necessary

Special Tools:

PWA 85749	Torque Adapter, Electronic Harness Connector

C. Procedure

See Figure 301, Figure 302, Figure 303, Figure 304, Figure 305, Figure 306, Figure 307, Figure 308, Figure 309, Figure 310, Figure 311, Figure 312, Figure 313, Figure 314, Figure 315, Figure 316, Figure 317 and Figure 318.

CAUTION: DO NOT TWIST OR BEND THE HARNESS BADLY DURING THE REMOVAL, OR DAMAGE TO THE HARNESS CAN OCCUR.

(1) Disconnect the W2P26 harness connector from the W5J26 harness connector located at the 11:30 o'clock position on the HPC case. Remove the two bolts and the harness bracket attaching the W5J26 harness connector flange to the HPC case bracket. Remove the connector from the bracket. Install a protective closure on each harness connector. See Figure 302 and Figure 303.

(2) (Pre SB PW4ENG 73-163) Disconnect the W6P12 harness connector from the W5J12 harness connector located on Flange K at the 3:30 o'clock position. Remove the two (2) bolts and harness bracket attaching the W5J12 harness connector flange to the Flange K bracket. Remove the connector from the bracket. Install a protective closure on each harness connector. See Figure 309 and Figure 314.

(3) (Post SB PW4ENG 73-163) Disconnect the W6P12 harness connector from the W5J12 harness connector located on the TCA tube flange bracket at the 3:30 o'clock position as follows:

(a) (Post SB PW4ENG 73−192) Loosen clamp that attaches the cooling hose to the cooling shield around the W5J12 connector. Remove cooling hose from the cooling shield.

NOTE: Pre SB PW4ENG 73−192 engines do not have W5/W6 wiring harness connector cooling.

(b) (Post SB PW4ENG 73−192) Loosen and remove the clamp attaching the two halves of the cooling shield around the W5J12 connector. Remove the shields and clamp from the connector.

(c) If necessary, remove or loosen bolt and clamp attaching wiring harness to the loop clamp bracket.

(d) Disconnect the W6P12 harness connector from the W5J12 harness connector.

(e) Remove the three (3) bolts and the loop clamp bracket that attach the W5J12 harness connector to the TCA tube flange bracket. Remove the connector from the bracket. Install a protective closure on each harness connector. See Figure 309 and Figure 314.

(4) For engines equipped with 2.95 bleed valve thermocouples only: Disconnect the W7P13 harness connector from the W5J13 harness connector located on a bracket on the right side of the main gearbox. Remove the two bolts and the harness bracket that attaches the W5J13 harness connector flange to the main gearbox bracket. Remove the connector from the bracket. Install a protection cover on each harness connector. See Figure 314.

(5) (Pre SB PW4ENG 72−572 or SB PW4ENG 75−106) Disconnect the W5P10 harness connector from the HPC secondary flow control valve located at the 9:30 o'clock position. Install a protective closure on the harness connector and the mating flow control valve position switch receptacle. See Figure 302 (Sheet 1).

NOTE: SB PW4ENG 72−572 or SB PW4ENG 75−106 removes connector W5P10 from the W5 wiring harness. See Figure 302 (Sheet 3).

(6) Disconnect the following harness connectors from the components given below. Install a protective closure on each harness connector and mating receptacle. See Figure 302 and Figure 310.

Connector	Component	Location
W5P5	Fuel/Oil Cooler Bypass Valve Solenoid (Rear Connector)	8 O'clock
W5P6	EEC Alternator (Lower Connector)	Bottom of Gearbox 7 O'clock

NOTE: Use a PWA 85749 Electronic Harness Connector Torque Adapter to disconnect the W5P6 harness connector.

Connector	Component	Location
W5P7	Variable Stator Vane Actuator (Top Connector)	4 O'clock
W5P11	Ninth Stage Start/Stability (2.9) Bleed Valve Solenoid (Inboard Connector)	Intermediate Case 5 O'clock

NOTE: Use a PWA 85749 Electronic Harness Connector Torque Adapter to disconnect the W5P11 harness connector.

Connector	Component	Location
W5P1	Fuel Metering Unit (Rear Connector)	Front Of Fuel Pump 5 O'clock
W5P8	EEC Fuel	Fuel Pump Housing 4:30 O'clock

(7) Remove the bolts, nuts, and clamps that attach the W5 harness to the brackets and tubes on the HPC case and the gearbox. See Figure 303, Figure 304, Figure 305, Figure 306, Figure 307, Figure 308 and Figure 311, Figure 312, Figure 313, Figure 314, Figure 315, Figure 316 and, Figure 317.

(8) Remove the applicable harness ties and carefully remove the W5 harness.

(9) If engine disassembly is necessary, remove the bolts, nuts, and washers that attach the top and lower harness support brackets (318/1, 318/5) to the right side of the HPC case. Remove the brackets. See Figure 318.

ENGINE GENERAL − INTERMEDIATE CASE − REMOVAL−23

Task 72−00−34−050−024:

1. Remove EEC Wiring Harness − W5 (Core Engine)

A. General

(1) To remove the EEC wiring harness − W3, see 72−00−34, Removal−18 (Task 72−00−34−050−018).

(2) To remove the EEC wiring harness − W4, see 72−00−34, Removal−19 (Task 72−00−34−050−019).

B. Equipment And Materials Required

Special Tools:

PWA 85749	Torque Adapter, Electronic Harness Connector

C. Procedure

See Figure 301, Figure 302, Figure 303, Figure 304, Figure 305, Figure 306, Figure 307, Figure 308, Figure 309, Figure 310, Figure 311, Figure 312, Figure 313, Figure 314, Figure 315, Figure 316, Figure 317 and, Figure 318.

CAUTION: DO NOT TWIST OR BEND THE HARNESS BADLY DURING THE REMOVAL, OR DAMAGE TO THE HARNESS CAN OCCUR.

NOTE: Items referred to as numbers in parenthesis in text are identified in Figure 317.

(1) Disconnect the W2P26 harness connector from the W5J26 harness connector located at the 11:30 o'clock position on the HPC case. Remove the two bolts and the harness bracket attaching the W5J26 harness connector flange to the HPC case bracket. Remove the connector from the bracket. Install a protective closure on each harness connector. See Figure 302 and Figure 303.

(2) (Pre SB PW4ENG 73−163) Disconnect the W6P12 harness connector from the W5J12 harness connector located on Flange K at the 3:30 o'clock position. Remove the two (2) bolts and harness bracket attaching the W5J12 harness connector flange to the Flange K bracket. Remove the connector from the bracket. Install a protective closure on each harness connector. See Figure 302 and Figure 303.

(3) (Post SB PW4ENG 73−163) Disconnect the W6P12 harness connector from the W5J12 harness connector located on the TCA tube flange bracket at the 3:30 o'clock position as follows. See Figure 309 and Figure 314 (Sheet 2):

(a) (Post SB PW4ENG 73−192) Loosen clamp that attaches the cooling hose to the cooling shield around the W5J12 connector. Remove cooling hose from the cooling shield.

NOTE: Pre SB PW4ENG 73−192 engines do not have W5/W6 wiring harness connector cooling.

(b) (Post SB PW4ENG 73−192) Loosen and remove the clamp attaching the two halves of the cooling shield around the W5J12 connector. Remove the shields and clamp from the connector.

(c) If necessary, remove or loosen bolt and clamp attaching wiring harness to the loop clamp bracket.

(d) Disconnect the W6P12 harness connector from the W5J12 harness connector.

(e) Remove the three (3) bolts and the loop clamp bracket that attach the W5J12 harness connector to the TCA tube flange bracket. Remove the connector from the bracket. Install a protective closure on each harness connector.

(4) For engines equipped with 2.95 Bleed Valve Thermocouple only: Disconnect the W7P13 harness connector from the W5J13 harness connector located on a bracket on the right side of the main gearbox. Remove the two bolts and the harness bracket that attaches the W5J13 harness connector flange to the main gearbox bracket. Remove the connector from the bracket. Install a protection cover on each harness connector. See Figure 314.

(5) Disconnect the following harness connectors from the components given below. Install a protective closure on each harness connector and mating receptacle. See Figure 302 and Figure 310.

Connector	Component	Location
W5P5	Fuel/Oil Cooler Bypass Valve Solenoid (Rear Connector)	8 O'clock
W5P6	EEC Alternator (Lower Connector)	Bottom of Gearbox 7 O'clock

NOTE: Use a PWA 85749 Electronic Harness Connector Torque Adapter to disconnect the W5P6 harness connector.

Connector	Component	Location
W5P7	Variable Stator Vane Actuator (Top Connector)	4 O'clock
W5P11	Ninth Stage Start/Stability (2.9) Bleed Valve Solenoid (Inboard Connector)	Intermediate Case 5 O'clock

NOTE: Use a PWA 85749 Electronic Harness Connector Torque Adapter to disconnect the W5P11 harness connector.

Connector	Component	Location
W5P1	Fuel Metering Unit (Rear Connector)	Front Of Fuel Pump 5 O'clock
W5P8	EEC Fuel	Fuel Pump Housing 4:30 O'clock

(6) Remove the bolts, nuts, and clamps that attach the W5 harness to the brackets and tubes on the HPC case and the gearbox. See Figure 303, Figure 304, Figure 305, Figure 306, Figure 307, Figure 308 and Figure 311 Figure 312, Figure 313, Figure 314, Figure 315, Figure 316 and, Figure 317.

(7) Remove the applicable harness ties and carefully remove the W5 harness.

(8) If engine disassembly is required, remove the bolts, nuts, and washers that attach the top and lower harness support brackets (318/1, 318/5) to the right side of the HPC case. Remove the brackets. See Figure 318.

ENGINE GENERAL - INTERMEDIATE CASE - REMOVAL-24

Task 72-00-34-050-022:

1. Remove Turbine Vane And Blade Cooling Air Valve, IDGS Air/Oil Heat Exchanger Valve Override Solenoid

A. Prerequisite

(1) Remove the fan exit liner segment (inner rear) at the 1 o'clock position. Refer to 72-00-33, Removal-16 (Task 72-00-33-040-001).

B. Equipment And Materials - None

C. Procedure

See Figure 301.

(1) Disconnect the W1P10 and W1P11 harness connectors from the solenoid.

(2) Remove the lockwire from the two tube nuts on the rear of the solenoid and disconnect the tubes.

(3) Remove lockwire from the pressure switch tube nuts. Disconnect and remove the tube. Install protection covers on the tube.

(4) Remove the four bolts that attach the solenoid, pressure switch bracket, and loop clamp bracket. Remove the pressure switch bracket. Remove the solenoid from under the loop clamp bracket and install protection covers.

(5) If the solenoid must be replaced do the following:

(a) Remove the two adapters and one plug from the rear of the solenoid.

(b) Remove lockwire and remove the cap from the adapter on top of the solenoid. Remove the two adapters from the top of solenoid.

(c) Install protection covers to all openings on the solenoid.

NOTE: For additional information concerning detailed maintenance of this component, see Compressor Heating Air/Turbine Vane Cooling Air Valve Solenoid Component Maintenance Manual, 75-33-12 (Midland Ross).

Task 72-00-34-050-023:

1. Remove Turbine Vane Cooling Air Valve, Turbine Vane And Blade Cooling Air Valve Solenoid

A. Prerequisites

(1) Remove the fan exit liner segment (inner rear) that is at the 10 o'clock position. Refer to 72-00-33, Removal-16 (Task 72-00-33-040-001).

B. Equipment And Materials - None

C. Procedure

See Figure 301.

(1) Disconnect W3P12 harness connector from the solenoid. Install protection covers on the harness and solenoid connectors.

(2) Remove lockwire from the three tube nuts on the rear of solenoid and disconnect the tube nuts from the solenoid.

(3) Remove four bolts that attach the solenoid and bracket to the case. Remove the solenoid from under the bracket and from the engine.

NOTE: If necessary, loosen the clamp bolt that attaches the tube to the bracket to gain clearance for solenoid removal.

(4) If the solenoid must be replaced, do the following:

(a) Remove the three adapters and gaskets from the rear of the solenoid.

(b) Remove lockwire and remove the two caps from the adapters on top of the valve. Remove the two adapters and gaskets from the top of the solenoid.

(c) Install protection covers to all openings on the valve solenoid.

NOTE: For additional information concerning detailed maintenance of this component, see Compressor Heating Air/Start Bleed Valve Solenoid Component Maintenance Manual, 75-33-10 (Midland Ross).

ENGINE GENERAL - INTERMEDIATE CASE - INSTALLATION-01

Task 72-00-34-420-001:

1. Install The Intermediate Case

NOTE: See Figure 401 for Part/Assembly Installation Procedure Sequence.

A. Prerequisites

(1) See Inspection/Check-01 (Task 72-00-34-990-001) for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Required

Special Tools:

PWA 27424	Pin, Aligning (3 Necessary)
PWA 28657	Sling
PWA 29855-7	Pin, Aligning (2 Necessary)
PWA 76156	Adapter, Lift And Trunnion
PWA 85064	Fixture, Handling
PWA 85246	Plug, Holding
PWA 85260	Pin, Aligning (2 Necessary)
PWA 87001	Driver, Hand
PWA 88709	Plug, Holding

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P06-002	Petrolatum, White (PMC 9609)
P06-021	Compound, Antigalling (PWA 550)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Insert, Helical Coil	AR	72-34-00/5/40
Packing	1	72-35-00/11/165
Packing	1	72-34-00/16/1

C. Procedure
See Figure 402.

(1) Install tools.

(a) Thread PWA 85246 Plug onto HPC rear hub at center of diffuser case.

(b) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3 (Pre SB PW4ENG 72−562) Thread the PWA 85246 Plug onto the HPC rear hub at the center of the diffuser case.

(c) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3 (Post SB PW4ENG 72−562) Thread the PWA 88709 Plug onto the HPC rear shaft at the center of the diffuser case.

(d) Put two PWA 76156 Adapters on PWA 28657 Sling.

(e) Attach the adapters to trunnion spools of PWA 85064 Fixture.

  1 Loosen knobs in center hub of fixture. With a hoist, install fixture to rear of diffuser case.

  2 Align dowel pin in fixture with hole in case and secure with detail washers and screws. Tighten the detail knobs.

(f) Raise HPC and diffuser and combustion assembly from build stand.

(g) Lubricate packing with Engine Oil P03−001, and install to OD flange of No. 2 bearing support at front of HPC.

(h) For engines that are post SB PW4ENG 72−48, install packing, lubricated with White Petrolatum P06−002, to intermediate case Flange E lip.

NOTE: Engines prior to SB PW4ENG 72−48 do not accept packing at Flange E.

(i) Install PWA 85260 Aligning Pins in intermediate case Flange E at 3 and 9 o'clock locations. Install PWA 29855−7 Pins in the intermediate case at Flange E at 6 and 12 o'clock.

(j) Install three PWA 27424 Aligning Pins, equally spaced, in the 33 hole diameter of the No. 2 bearing support (installed in the HPC).

ENGINE GENERAL − INTERMEDIATE CASE − INSTALLATION−01

(2) Inspect the intermediate case Flange E helical coil inserts. If you find any damaged helical coil inserts, replace the insert(s) as follows:

(a) With pliers, remove the damaged insert. Discard the insert.

(b) Install a new insert on PWA 87001 Driver.

(c) Install the driver through the boltholes in Flange E.

(d) Install a socket and wrench on the driver.

(e) Install the insert in the Flange E. The top coil must be 1 − 1.5 pitch below the surface.

(3) Attach the engine to the intermediate case as follows.

(a) Lower HPC and diffuser and combustion assembly to intermediate case.

(b) Install 8 to 10 workbolts in the 33 bolt circle of the No. 2 bearing support. Remove the alignment pins.

(c) Install 8 to 10 workbolts, with Antigalling Compound P06−021 applied on the threads, in Flange E. Remove the alignment pins.

(d) Tighten the workbolts at Flange E and the No. 2 bearing support at the same time.

1 Tighten and torque the No. 2 bearing support workbolts to 180 − 200 lb−in. (20.337 − 22.597 N.m).

2 Tighten and torque the Flange E workbolts to 225 − 250 lb−in. (25.422 − 28.246 N.m).

(e) Install the Flange E hardware as follows. Refer to 72−00−34 Installation−20 (Task 72−00−34−420−020).

NOTE: Flange E has two configurations, the UPS configuration has 72 bolts and the other configuration has 74 bolts.

(f) Tighten and torque Flange E bolts to 225 - 250 lb-in. (25.422 - 28.246 N.m).

(g) If you trunnion the engine, leave the workbolts installed in the No. 2 bearing support. If not, remove the workbolts.

(h) Remove the hoist, sling, and adapters from diffuser and combustion fixture.

D. Postrequisites

(1) Trunnion The Intermediate Case Through Diffuser And Combustor From Front End Down To Horizontal Position. Refer to 72-00-00, Special Procedures-10 (Task 72-00-00-420-002-A00).

(2) Install The No. 1.5 Bearing Support Assembly On The Intermediate Case. Refer to 72-00-34, Installation-06 (Task 72-00-34-430-001).

(3) Connect/Install External Parts To Complete Installation Of Intermediate Case. Refer to 72-00-34, Installation-02 (Task 72-00-34-420-002).

(4) Install The No. 3 Bearing Rear (Carbon) Seal Assembly And Rear Seal Seat. Refer to 72-00-41, Installation-03 (Task 72-00-41-420-003).

(5) Install The Turbine Nozzle. Refer to 72-00-51, Installation-01 (Task 72-00-51-420-001).

(6) Install The High Pressure Turbine (HPT). Refer to 72-00-52, Installation-01 (Task 72-00-52-420-001).

(7) Install The No. 1 Bearing Vibration Transducer, if applicable. Refer to 72-00-34, Installation-22 (Task 72-00-34-440-001).

(8) Install The No. 1 Bearing Support (Front And Rear) Assembly. Refer to 72-00-34, Installation-04 (Task 72-00-34-450-002).

(9) Install The Fan Case. Refer to 72-00-33, Installation-01 (Task 72-00-33-420-001).

(10) Install The Low Pressure Turbine (LPT) With Shaft. Refer to 72-00-53, Installation-01 (Task 72-00-53-420-001).

(11) Install The Turbine Exhaust Case. Refer to 72−00−54, Installation−01 (Task 72-00-54-020-001).

(12) Install The Low Pressure Compressor (LPC). Refer to 72−00−31, Installation−01 (Task 72-00-31-420-003).

(13) Install The LPC/LPT Coupling. Refer to 72−00−32, Installation−01 (Task 72-00-32-420-001).

(14) Install All Stage 1 LPC Blade Assemblies. Refer to 72−00−31, Installation−04 (Task 72-00-31-420-002-002).

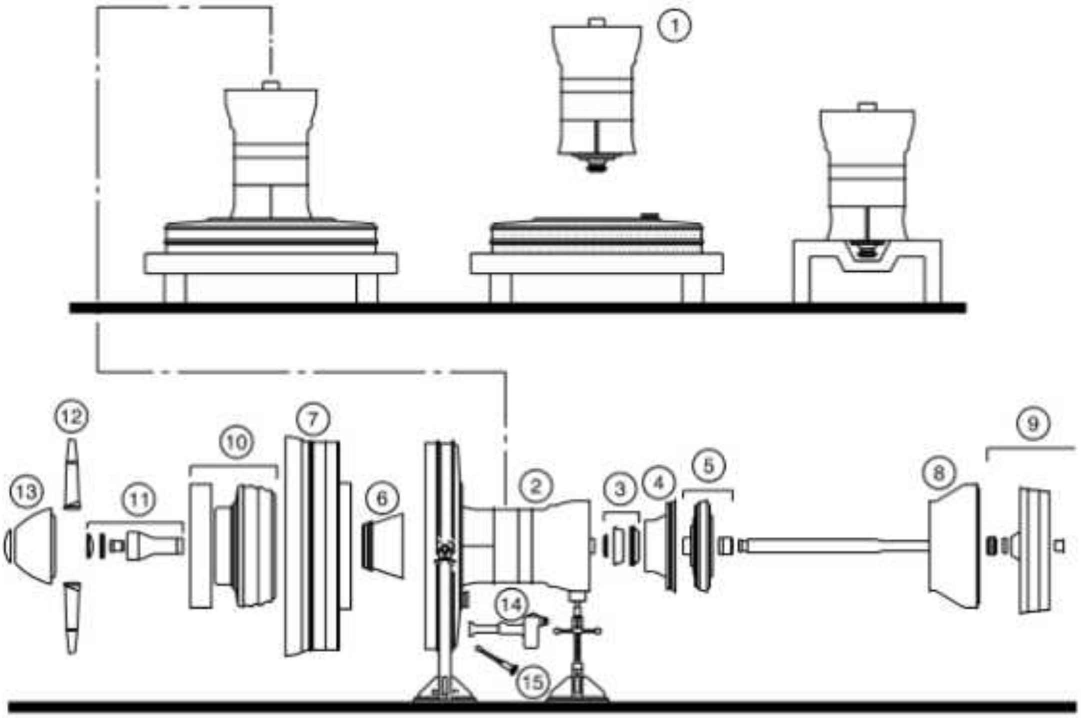
(15) Install The Compressor Inlet Cone. Refer to 72−00−31, Installation−02 (Task 72-00-31-420-001).

(16) Install The Main Gearbox. Refer to 72−00−61, Installation−01 (Task 72-00-61-420-001).

(17) For engines not equipped with engine multiplexer unit (PMUX) or the supplemental control unit, Install Electronic Engine Control (EEC) Speed Transducer (N1). Refer to 72−00−34, Installation−03 (Task 72-00-34-450-001).

(18) For engines equipped with engine multiplexer unit (PMUX) or the supplemental control unit, Install Electronic Engine Control (EEC) Speed Transducer (N1) Multiplexer Input Probe. Refer to 72−00−34, Installation−17 (Task 72-00-34-450-013).

ENGINE GENERAL − INTERMEDIATE CASE − INSTALLATION−01



1. INSTALL DIFFUSER AND HIGH PRESSURE COMPRESSOR TO INTERMEDIATE CASE.
2. TRUNNION INTERMEDIATE THROUGH DIFFUSER CASE TO HORIZONTAL.
3. INSTALL NO. 3 BEARING REAR SEAL ASSEMBLY AND REAR SEAL PLATE.
4. INSTALL TURBINE NOZZLE.
5. INSTALL HIGH PRESSURE TURBINE (HPT).
6. INSTALL NO. 1 BEARING SUPPORT ASSEMBLY.
7. INSTALL FAN CASE.
8. INSTALL LOW PRESSURE TURBINE (LPT).
9. INSTALL TURBINE EXHAUST CASE.
10. INSTALL LOW PRESSURE COMPRESSOR (LPC).
11. INSTALL LPC/LPT COUPLING.
12. INSTALL STAGE 1 LPC BLADE ASSEMBLIES.
13. INSTALL COMPRESSOR INLET CONE.
14. INSTALL MAIN GEARBOX.
15. INSTALL ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).

Task 72-00-34-420-002:

1. Install External Plumbing After Intermediate Case Installation

A. Equipment And Materials Required

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
R	P05-292	Ferrule, Safety Cable (Optional)
	P06-021	Antigalling Compound (PWA 550-3)
R	P06-054	Antiseize Paste (PWA 36246)
	P18-003	Primer, Zinc Chromate (AMS 3110)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	79-23-00/1/1
Key Washer	4	79-23-00/1/50

B. Procedure

See Figure 401.

ENGINE GENERAL − INTERMEDIATE CASE − INSTALLATION−02

CAUTION: DO NOT USE LUBRICANTS ON PMUX SENSING TUBES, ADAPTERS, OR PACKINGS. CONTAMINATION OF PMUX CAN RESULT.

(1) For engines equipped with engine propulsion multiplexer unit (PMUX), install (lower) PT2.5 sensing manifold assembly (AS31) as follows.

  (a) Remove protective closures.

  (b) Install manifold to Flange E bracket and HPC case bracket at approximately 5 and 4:30 o'clock positions. Secure with clamps, bolts, threads lubricated with Engine Oil P03−001, and nut handtight only.

  (c) If cap at tee end of manifold has been removed or loosened, torque cap to 135 − 150 lb−in. (15.253 − 16.948 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

  CAUTION: DO NOT USE LUBRICANTS ON PMUX SENSING TUBES, ADAPTERS, OR PACKINGS. CONTAMINATION OF PMUX CAN RESULT.

(2) For engines equipped with engine propulsion multiplexer unit (PMUX), install (upper) PT2.5 sensing tube assembly (AS30) as follows.

  (a) Remove protective closures.

  (b) Install tube to previously installed manifold handtight only.

  (c) Install clamps and bolts securing tube to three Flange E brackets between 1 and 4 o'clock postions. Torque clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

  (d) Torque manifold nut to tube coupling at approximately 4 o'clock position to 135 − 150 lb−in. (15.253 − 16.948 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

    NOTE: Lower manifold nut and clamp bolts shall be torqued with probe installation.

CAUTION: DO NOT USE LUBRICANTS ON THE SUPPLEMENTAL CONTROL UNIT (SCU) SENSING TUBES, ADAPTERS, OR PACKINGS. LUBRICANTS CAN CAUSE CONTAMINATION OF THE SCU.

(3) For engines equipped with the supplemental control unit (SCU) with multiplexing, install the PT2.5 sensing tube assembly (AS35) as follows.

(a) Remove the protection covers.

(b) Attach the (AS35) tube to brackets on Flange E at the 4:30 and 5:00 o'clock positions with clamps and bolts, threads lubricated with Engine Oil P03−001 and tighten by hand.

(4) Install the upper PT2.5 sensing tube assembly (AS30) as follows.

(a) Remove the protection covers.

(b) For engines equipped with the supplemental control unit (SCU) with multiplexing, install the (AS30) tube to the (AS35) tube assembly and tighten the tube nut by hand.

(c) Install clamps to the (AS30) tube and attach the clamps to brackets on Flange E with four bolts and a nut. Lubricate the threads with Engine Oil P03−001. Torque the bolts and a nut to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(d) For engines not equipped with the supplemental control unit (SCU) with multiplexing, install a cap assembly to the lower end of the (AS30) tube. Torque the cap assembly 135 − 150 lb−in. (15.253 − 16.948 N.m). Safety the cap assembly with Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(5) For engines equipped with the supplemental control unit (SCU) with multiplexing, do as follows.

(a) Torque the bolts that attach the (AS35) tube to brackets on Flange E to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(b) Torque the tube nut tube (AS35) to the tube coupling tube (AS30) to 135 − 150 lb−in. (15.253 − 16.948 N.m). Safety the tube nut with Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

NOTE: The manifold (AS31) is installed and torqued with the probe installation.

(6) If HPC was disassembled comply with the following. See Figure 402.

(a) Install gearbox oil pressure manifold assembly (LP08) as follows.

1 Remove protective closures. Lubricate manifold nut threads with Antigalling Compound P06−021. See Figure 402 (Sheet 6). Install tube to inboard adapter at top of fuel/oil cooler handtight only.

2 (Post SB PW4ENG 72−491) Position tube and attach to Flange H bracket assembly at approximately 9 o'clock position, with clamp and bolt, lubricated with Engine Oil P03−001. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

3 Lubricate threads on manifold tee with Antigalling Compound P06−021 and attach No. 4 bearing oil pressure tube nut. Torque tube nut to manifold tee to 340 − 375 lb−in. (38.415 − 42.369 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

4 Position spray shield to inboard side of connection and secure with hose clamp.

5 (Reference 2151) Torque hose clamp to 15 − 18 lb−in. (1.695 − 2.034 N.m).

6 Torque manifold nut to fuel/oil cooler adapter to 675 − 750 lb−in. (76.265 − 84.739 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(b) Install (lower) No. 3 bearing oil breather tube assembly (LB04) as follows.

1 Remove protective closures and lubricate tube nut threads with Antigalling Compound P06-021. See Figure 402 (Sheet 5). Install tube between fuel/oil cooler and HPC case. Connect tube nut to tube coupling rearward of Flange K at approximately 10 o'clock position.

2 Install clamp and bolt, threads lubricated with Engine Oil P03-001, to bracket attached to rear support of fuel/oil cooler at approximately 9 o'clock position handtight only.

3 Identify tube nut as being "not torqued" with tag. Tube nut to be torqued in 72-00-61 Installation-02 (after installation of main gearbox).

(c) Install the (front) No. 3 bearing oil pressure manifold assembly (LP18) as follows.

1 (Pre SB PW4ENG 79-52), Remove the protection covers and lubricate the manifold nut
R threads with Antiseize Paste P06-054. Wipe
R off unwanted paste. Install the packing, lubricated with Engine Oil P03-001, and the retainer to the manifold.

2 (Post SB PW4ENG 79-52), Remove protection covers and lubricate the back of the manifold ferrules and the manifold nut threads with Antigallant Compound P06-021. See Figure 402 (Sheet 4). Lubricate the the packing with Engine Oil P03-001 and install the packing and retainer to the manifold.

3 (Pre SB PW4ENG 79-52), Install the manifold to the rear of the strainer housing on the fuel/oil cooler and to the No. 3 bearing oil strainer housing on Flange K. Tighten by hand only.

4 (Post SB PW4ENG 79-52), Install the manifold to the rear of the strainer housing on the fuel cooler and to the adapter on the No. 3 bearing pressure tube (LP19) on Flange K at the 9 o'clock position.

5 Install the clamp and bolt, lubricated with Engine Oil P03−001, that attach the manifold and the (LB04) tube (above) to the bracket attached to the rear of the cooler. Tighten by hand.

CAUTION: DO NOT TORQUE THE MANIFOLD NUTS OR THE CLAMP BOLTS AT THIS TIME. YOU MUST COMPLETE THE INSTALLATION OF THIS MANIFOLD AFTER YOU INSTALL OTHER TUBES AFTER THE GEARBOX INSTALLATION. THIS WILL PREVENT ANY TWIST DAMAGE TO THE TUBES.

6 Do not torque the manifold nuts or clamps bolts at this time. Install a tag on the manifold "not torqued".

(d) Install the oil pressure trim tube assembly (LP31) and the oil metering nipple (restrictor) as follows.

1 Remove the protection covers and lubricate the tube nut threads with Antigalling Compound P06−021.

2 Install the trim tube (LP31) to the oil manifold tee (LP18) above the cooler. Tighten by hand only.

3 Remove the protection covers and install the oil metering nipple (restrictor) to the trim tube (LP31). Tighten by hand only.

CAUTION: DO NOT TORQUE THE TRIM TUBE (LP31) OR THE NIPPLE (RESTRICTOR) AT THIS TIME. YOU MUST COMPLETE THE INSTALLATION OF THIS TUBE AND NIPPLE (RESTRICTOR) AFTER YOU INSTALL OTHER TUBES AFTER THE GEARBOX INSTALLATION. THIS WILL PREVENT ANY TWIST DAMAGE TO THE TUBES.

4 Do not torque the tube nuts or nipple at this time. Install a tag on the tube and nipple "not torqued".

NOTE: You will complete the installation of the above manifold (LP18), tube (LP31), and nipple in 72-00-61, Installation-02 Task 72-00-61-420-002. See the installation of the oil trim pressure tube (LP32).

(e) Install (lower) No. 1, 1.5 and 2 bearing breather oil tube assembly (LB02) as follows.

1 Position tube and secure to Flange H bracket, at approximately 9 o'clock position, with clamp, bolt, threads lubricated with Engine Oil P03-001, and nut handtight only.

2 Identify clamp bolt as being "not torqued" with tag. Clamp bolt to be torqued in 72-00-61 Installation-02 (after installation of main gearbox).

3 Install a clamp to the No. 1, 1.5 and 2 bearing breather tube (lower) (LB02) and put to the inboard oil cooler bracket. Attach the clamp to the bracket with a bolt, threads lubricated with Engine Oil P03-001 and a nut tightened by hand (Post SB PW4ENG 79-33).

4 Identify the bolt in the clamp on the inboard oil cooler bracket as "not torqued" with a tag. The bolt will be torqued in 72-00-61, Installation-02 (after the installation of the main gearbox) (Post SB PW4ENG 79-33).

5 Installation of tube to be completed in 72-00-61 Installation-02.

(f) Install oil cooler outlet fuel tube assembly (FM11) (Pre SB PW4ENG 73-35) as follows. See Figure 403.

1 Remove protective closures and lubricate tube nut threads with Engine Oil P03-001. Install packing, lubricated with Engine Oil P03-001, and retainer to cooler end of tube. Install tube to rear adapter on fuel/oil cooler at approximately 8:30 o'clock position handtight only.

2 Install clamp, bolt, threads lubricated with Engine Oil P03-001, and nut securing tube to Flange J bracket at approximately 7 o'clock position. Torque clamp bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

3 Torque tube nut to fuel/oil cooler rear adapter to 100 - 110 lb-in. (11.298 - 12.428 N.m), loosen tube nut, then retorque to same limit. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(g) Install flexible oil cooler outlet fuel hose and tube assembly (FM11) (Post SB PW4ENG 73-35) as follows.

1 Remove the protective closures.

a Inspect the primed surface for nicks, scratches or areas of missing coating. If any, apply wet Zinc Chromate Primer P18-003 to those exposed areas. Allow to air dry a minimum of 10 minutes before assembly to the fuel pump.

2 Lubricate tube nut threads with Engine Oil P03-001. Install packing, lubricated with Engine Oil P03-001, and retainer to cooler end of tube. Install tube to rear adapter on fuel/oil cooler at approximately 8:30 o'clock position handtight only.

3 Install clamp and bolt, threads lubricated with Engine Oil P03-001, securing tube to Flange J bracket at approximately 7 o'clock position. Torque clamp bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

4 (Reference 2170) Torque the tube nut to the fuel/oil cooler rear adapter to 150 - 160 lb-in. (16.948 - 18.078 N.m). Torque the tube nut again to 150 - 160 lb-in. (16.948 - 18.078 N.m) until the torque is kept. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(h) Install oil cooler inlet fuel tube assemblies (FM10) and (FM12) as follows.

1 Remove protective closures and lubricate tube nut threads at cooler end with Engine Oil P03−001. Install packings lubricated with Engine Oil P03−001 and retainers to cooler end of tubes. Install tubes to forward adapters on fuel/oil cooler at approximately 8:30 o'clock position handtight only.

2 Install clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts securing tubes to HPC case brackets at two locations. Torque clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

3 (Reference 2170) Torque the tube nuts at the cooler ends to 150 − 160 lb−in. (16.948 − 18.078 N.m). Torque the tube nuts again to 150 − 160 lb−in. (16.948 − 18.078 N.m) until the torque is kept. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292. Fuel pump ends of tubes to be torqued in 72−00−61 Installation−05.

(i) Install (airframe) oil cooler inlet oil tube assembly (LS05) as follows.

1 Remove protective closures and lubricate tube nut threads with Antigalling Compound P06−021. Install packing, lubricated with Engine Oil P03−001, and retainer to cooler end of tube. Install tube to forward adapter on oil cooler bypass valve handtight only.

2 Install clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts securing tube to previously installed tube and HPC case bracket. Torque clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

3 Torque tube nut to oil cooler bypass valve adapter to 140 − 160 lb−in. (15.818 − 18.078 N.m), loosen tube nut, then retorque to same limits. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(7) Connect No. 3 bearing air cooler tube assemblies (AP33) and (AP34) as follows. See Figure 404.

R R (a) Lubricate tube nut threads with Antiseize Paste P06-054. Wipe off unwanted paste. Install tube nuts to adapters and torque to 825 - 900 lb-in. (93.212 - 106.686 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(8) Install bleed valve supply tube assemblies (AA26), (AA27), and (AA29) as follows. See Figure 404 (Sheets 4 and 5).

R R (a) Remove protective closures and lubricate all tube nut and coupling threads with Antiseize Paste P06-054. Wipe off unwanted paste. Install inboard tube (AA26), to upper tube nut (AA24), beneath turbine cooling air valve actuator at approximately 2 o'clock position and to air valve solenoid at 5 o'clock position in intermediate case handtight only. Connect tube nut (AA36) to lower tube tee (AA26).

(b) For engines with maintenance break at 3 o'clock position (Pre SB PW4ENG 75-28), install upper middle tube (AA29), to middle tube coupling (AA30), beneath turbine cooling air valve actuator at approximately 2 o'clock position handtight only. Install lower middle tube (AA37) to tube coupling of previously installed tube (AA29) and to pneumatic relay valve at approximately 5 o'clock position handtight only.

(c) For engine equipped with maintenance break at 5 o'clock position (Post SB PW4ENG 75-28), install middle tube to middle tube coupling (AA29) beneath turbine cooling air valve actuator at 2 o'clock position handtight only. Install lower end of tube (AA29) to tube coupling (AA37) rearward of solenoid at 5 o'clock position handtight only.

(d) Install outboard tube (AA27), to lower tube nut (AA28), beneath turbine cooling air valve actuator at approximately 2 o'clock position and to air valve solenoid at 5 o'clock position in intermediate case handtight only.

(e) Install clamps, bolts, threads lubricated with Engine Oil P03-001, nuts and spacer securing tubes to brackets and each other.

(f) Torque all clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(g) Torque three tube nuts (AA24), (AA30), and (AA28) beneath turbine cooling air valve actuator at approximately 2 o'clock position to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(h) For engine equipped with maintenance break at 3 o'clock position (Pre SB PW4ENG 75-28), torque middle tube nut (AA29) at 3 o'clock position to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(i) Torque tube nut (AA36) attached to inboard tube tee (AA26) at approximately 5 o'clock position to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(j) Torque inboard tube nut (AA26) to adapter on air valve solenoid at 5 o'clock position to 225 - 250 lb-in. (25.422 - 28.246 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(k) For engines equipped with maintenance break at 3 o'clock position (Pre SB PW4ENG 75-28), torque lower middle tube nut (AA37) to adapter on pneumatic relay valve at 5 o'clock position to 225 - 250 lb-in. (25.422 - 28.246 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(l) For engines equipped with maintenance break at 5 o'clock position (Post SB PW4ENG 75-28), torque lower middle tube nut (AA29) to tube coupling (AA37) at 5 o'clock position to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(m) Torque outboard tube (AA27) to adapter on air valve solenoid at approximately 5 o'clock position to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(9) Install (lower right) airframe cooler outlet oil tube assembly (LS06) and (upper right) airframe cooler outlet tube assembly (LS03) as follows.

(a) Remove protective closures and lubricate (lower
right) tube nut and coupling threads with
R Antiseize Paste P06−054. Wipe off unwanted paste.

(b) Position (lower right) tube to bracket attached to rear of stator vane lever support and to Flange H bracket at approximately 4:30 o'clock position. Connect tube nut to tube coupling at 5:00 o'clock position handtight only.

(c) Install clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts securing tube to bracket attached to rear of stator vane lever support and to Flange H bracket at approximately 4:30 o'clock position. Torque clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(d) Remove protective closures and install packing
lubricated with Engine Oil P03−001 to groove at
flanged end of (upper right) tube. Lubricate tube
R nut threads with Antiseize Paste P06−054. Wipe
R off unwanted paste.

(e) Install (upper right) tube to air/oil cooler and to (lower right) tube coupling. Install three bolts, threads lubricated with Engine Oil P03−001.

(f) Torque bolts securing flanged end of tube to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(g) Torque two tube nuts to 675 − 750 lb−in. (76.265 − 84.739 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 at approximately 5 and 3 o'clock positions.

(10) Install (right) HPC air valve signal tube assembly (AA01) and (right) HPC air valve supply tube assembly (AA25) as follows.

(a) Remove protective closures and lubricate tube nuts
R with Antiseize Paste P06−054. Wipe off unwanted
R paste.

(b) Install supply tube (AA25) to tee forward of upper air filter at approximately 2 o'clock position and to adapter on air valve solenoid at approximately 1 o'clock position in intermediate case handtight only.

(c) Install signal tube (AA01) to lower air filter at approximately 2 o'clock position and to adapter on air valve solenoid at approximately 1 o'clock position in intermeidate case handtight only.

(d) Install clamps, bolts, threads lubricated with Engine Oil P03−001, spacer, and nuts securing tubes to HPC case bracket and to Flange H bracket at approximately 12:30 o'clock position handtight only.

(e) Install clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts securing tubes to bracket attached to bleed valve flange at approximately 1:30 o'clock position handtight only.

(f) Torque all clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(g) Torque rear connections of both tubes to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(h) Torque the larger front connection (supply) (AA25) to 225 − 250 lb−in. (25.422 − 28.246 N.m).

(i) Torque the smaller front connection (signal) (AA01) to 170 − 180 lb−in. (19.207 − 20.337 N.m).

(j) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(11) Install angle gearbox oil pressure tube assembly (LP09) as follows. See Figure 405.

(a) Remove protection covers and lubricate tube nut
R threads with Antiseize Paste P06−054. Wipe off
R unwanted paste. Install tube to adapter on right side of angle gearbox and to manifold tee at approximately 7:30 o'clock position handtight only.

(b) Install clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts securing tube to brackets.

(c) (Post SB PW4ENG 72−507) Install two more clamps with a bolt, threads lubricated with Engine Oil P03−001, and a nut, 1.250 − 1.750 inches (31.8 − 44.4 mm) to the rear of the installed clamps. See Figure 405 (Sheet 8).

(d) Torque all clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(e) Torque tube nuts to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(12) Install bottom hydraulic manifold assembly (CP02) and (bottom) oil cooler inlet return manifold assembly (CR04) as follows.

(a) Remove protective closures and lubricate manifold
R nut threads with Antiseize Paste P06−054. Wipe
R off unwanted paste. Install return manifold to adapter on front of fuel/oil cooler at approximately 9 o'clock position handtight only.

(b) Install hydraulic manifold and secure both manifolds to Flange E brackets at approximately 8 and 5 o'clock positions with clamps and bolts, threads lubricated with Engine Oil P03−001. Torque clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) Torque return manifold nut to fuel/oil cooler to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

ENGINE GENERAL − INTERMEDIATE CASE − INSTALLATION−02

(13) Install (right) hydraulic manifold assembly (CP05) and (right) oil cooler inlet return manifold assembly (CR01) as follows.

(a) Remove protective closures and lubricate manifold
R nut threads with Antiseize Paste P06−054. Wipe
R off unwanted paste. Install both manifolds to
bottom manifolds at approximately 5 o'clock position and to flex hoses at approximately 3 o'clock position handtight only.

(b) Install clamps, bolt, threads lubricated with Engine Oil P03−001, and nut securing manifolds to brackets.

(c) Torque all clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(d) Torque nuts (smaller) connecting each end of return manifold to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(e) Torque nuts (larger) connecting each end of hydraulic manifold to 340 − 375 lb−in. (38.415 − 42.369 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

CAUTION: MAKE SURE YOU CONNECT THE TUBES TO THE CORRECT CONNECTORS OR FAULT MESSAGES WILL BE GENERATED.

(14) Install (right) air/oil cooler valve hydraulic tube assembly (CP13) and (right) air/oil cooler valve return tube assembly (CR12) as follows.

(a) Remove protective closures.

R (b) Lubricate tube nut threads with Antiseize Paste
R P06−054. Wipe off unwanted paste.

(c) Attach both tubes to the adapters on the air/oil heat exchanger at approximately the 4 o'clock position in intermediate case and to the manifold tees.

1 The CR12 tube is installed to the adapter that is furthest from the lower triangular pad on the exchanger. The CP13 tube is installed to the adapter that is closest to the lower triangular pad on the exchanger.

(d) (Reference 256) Torque the two forward tube nuts attached to the heat exchanger tube couplings to 140 − 160 lb−in. (15.818 − 18.078 N.m).

(e) Torque the return tube (CR12) (smaller nut) to the manifold tee to 200 − 225 lb−in. (22.597 − 25.422 N.m).

(f) Torque the pressure tube (CP13) (larger nut) to the manifold tee to 340 − 375 lb−in. (38.415 − 42.369 N.m).

(g) Safety all the tube nuts with Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(15) Install compressor stator cylinder hydraulic tube assembly (CP12) and compressor stator cylinder return tube assembly (CR03) as follows.

(a) Remove protective closures.

(b) Lubricate tube nut threads (both tubes) with
R Antiseize Paste P06−054. Wipe off unwanted paste.

(c) Install tubes to adapters on compressor stator cylinder and manifold tees at approximately 5 o'clock position handtight only.

(d) Install clamps and bolts, threads lubricated with Engine Oil P03−001, securing tubes to Flange E bracket. Torque bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(e) Torque return tube nuts (smaller) to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(f) Torque hydraulic tube nuts (larger) to 225 − 250 lb−in. (25.422 − 28.246 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(16) Install (left) air/oil valve cooler hydraulic tube assembly (CP07) and (left) air/oil cooler valve return tube assembly (CR05) as follows.

(a) Remove protective closures.

(b) Lubricate tube nut threads (both tubes) with
R Antiseize Paste P06−054. Wipe off unwanted paste.

(c) Install tubes (longer staighter end) to adapters on (left) air/oil heat exchanger at approximately 8 o'clock position and to manifold tees.

(d) Install clamps and bolts, threads lubricated with Engine Oil P03−001, securing tubes to Flange E bracket. Torque the clamp bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(e) Torque the two forward tube nuts attached to the heat exchanger tube couplings to 200 − 225 lb−in. (22.597 − 25.422 N.m).

(f) Torque the return tube (CR05) (smaller nut) to the manifold tee to 200 − 225 lb−in. (22.597 − 25.422 N.m).

(g) Torque the pressure tube (CP07) (larger nut) to the manifold tee to 225 − 250 lb−in. (25.422 − 28.246 N.m).

(h) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to all the tube nuts.

(17) Install bleed valve cylinder hydraulic tube assembly (CP06) and bleed valve cylinder return tube assembly (CR02) as follows.

(a) Remove protective closures.

(b) Lubricate return tube nut threads with Engine Oil P03−001 and install to manifold tee and 2.5 bleed valve cylinder adapter at approximately 7 o'clock position in intermediate case.

(c) Torque tube nuts to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(d) Lubricate hydraulic tube nut threads with
R Antiseize Paste P06−054 and install tube to
manifold tee and 2.5 bleed valve cylinder adapter.
R Wipe off unwanted paste.

(e) Install clamps, bolt, threads lubricated with Engine Oil P03−001, and nut securing the two tubes to each other. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(f) Torque hydraulic tube nut to manifold tee to 340 − 375 lb−in. (38.415 − 42.369 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(g) Torque hydraulic tube nut to bleed cylinder adapter to 225 − 250 lb−in. (25.422 − 28.246 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(18) Install HPC valve cooling air tube assembly (AC35) as follows. See Figure 406.

(a) Remove protective closures.

(b) Install tube to intermediate case at approximately 10 o'clock position and secure with two bolts, threads lubricated with Engine Oil P03−001, handtight only.

(c) Install clamp, bolt, threads lubricated with Engine Oil P03−001, and nut securing tube to bracket attached to solenoid. Torque clamp bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(d) Torque two bolts securing front tube flange to intermediate case to 85 − 95 lb−in. (9.604 − 10.734 N.m).

CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTION USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF THE TUBE OR AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE EXTERNAL WIRE BRAID AND IN THE

INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(19) Install air/oil cooler outlet oil hose and tube assembly (LP03) as follows.

(a) Remove protective closures.

(b) Inspect the primed surface for nicks, scratches or areas of missing coating. If any, apply wet Zinc Chromate Primer P18-003 to those exposed areas. Allow to air dry a minimum of 10 minutes before assembly. Do not apply primer to the packing groove or on the surface adjacent to the packing groove.

(c) Install new packing, lubricated with Engine Oil P03-001, to groove at flanged end of tube.

(d) Install new packing, lubricated with Engine Oil P03-001, and retainer to nut end of tube.

(e) Lubricate tube nut threads with Engine Oil P03-001 and install tube to fuel/oil cooler and air/oil heat exchanger. Secure flanged end of tube to air/oil heat exchanger with three bolts, threads lubricated with Engine Oil P03-001, handtight only.

(f) Secure tube to HPC case bracket at approximately 8 o'clock position with clamp, bolt, threads lubricated with Engine Oil P03-001. Torque clamp bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(g) Torque tube nut to 200 - 220 lb-in. (22.597 - 24.857 N.m). Loosen tube nut, then retorque to same limit. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(h) Front tube flange bolts to be torqued with installation of air/oil cooler inlet oil tube. See 72-00-61 Installation-02.

(20) Install main bearing breather tube assemblies (LB01) and (LB06) as follows.

(a) Remove protective closures.

(b) Install gasket and upper tube (LB01) to intermediate case at approximately 11:30 o'clock position and secure with four bolts, threads lubricated with Engine Oil P03-001, and lockwashers handtight only.

(c) Lubricate the middle tube (LB06) coupling, and coupling nut threads (both end fittings) with R Antiseize Paste P06-054 and install to upper tube (LB01) and the lower tube nut (LB02) above fuel/oil cooler at approximately 9 o'clock R position handtight only. Wipe off unwanted paste.

(d) Secure tube to HPC case brackets at approximately 11:30 and 10 o'clock positions with clamps, bolts, threads lubricated with Engine Oil P03-001. Torque clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(e) Torque four bolts securing upper tube to intermediate case to 65 - 85 lb-in. (7.344 - 9.604 N.m) and bend tabs on lockwashers against flats of bolts to secure.

(f) Torque lower tube nut to upper tube at approximately 11:30 o'clock position to 1150 - 1300 lb-in. (129.933 - 146.880 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(g) Identify tube nut connecting tube (LB06) to tube (LB02, located above fuel/oil cooler at approximately 9 o'clock position as "Not Torqued", with a "Not Torqued" tag. Tube nut to be torqued after installation of main gearbox. See 72-00-61, Installation-02.

(21) Install main bearing oil pressure manifold assembly (LP07) as follows.

(a) Remove protective closures.

(b) Install new packing to last chance strainer. Lubricate packing and threads with Engine Oil P03-001 and install strainer to strainer housing. Torque to 275 - 300 lb-in. (31.071 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(c) Install packing lubricated with Engine Oil P03-001 to flanged end of manifold. Install manifold to intermediate case at approximately 9 o'clock position with three bolts, threads lubricated with Engine Oil P03-001, handtight only.

(d) Secure manifold to Flange E bracket with clamp, bolt, threads lubricated with Engine Oil P03-001, and nut. Torque clamp bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(e) Torque three bolts securing front flanged end of tube to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(22) Install main bearing oil pressure tube assembly (LP05) as follows.

(a) Remove protective closures.

(b) Install new packing, lubricated with Engine Oil P03-001, and retainer to rear of tube.

(c) Lubricate tube nut threads at both ends with R Antiseize Paste P06-054. Wipe off unwanted paste. Install tube to last chance strainer housing adjacent to Flange E and to adapter above fuel/oil cooler handtight only.

(d) Install clamp and bolt, threads lubricated with Engine Oil P03-001, securing tube to Flange E bracket. Torque bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(e) Install a bracket, clamps, bolts, threads lubricated with Engine Oil P03-001, and nuts to the main bearing breather tube (LB06) and the main bearing oil pressure tube (LP05). Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m). See View N (Post SB PW4ENG 79-33).

(f) Torque forward tube nut to strainer housing to 675 - 750 lb-in. (76.265 - 84.739 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(g) Torque rear tube nut to 140 − 160 lb−in. (15.818 − 18.078 N.m). Loosen tube nut, then retorque to same limit. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(23) Install HPC air valve and air shutoff valve supply tube assembly (AA22) as follows.

(a) Remove protective closures.

(b) Lubricate tube nut and coupling threads with
R Antiseize Paste P06−054 and install tube to middle
solenoid adapter at approximately 10 o'clock
position in intermediate case and to tube adjacent
R to air filters handtight only. Wipe off unwanted
R paste.

(c) Install clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts securing tube to Flange E bracket, Flange H bracket, and HPC case bracket. Torque bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(d) Torque tube (AA22) to solenoid adapter to 225 − 250 lb−in. (25.422 − 28.246 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(e) Torque tube nut (AA34) to the tube coupling (AA22). to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(24) Install air shutoff valve signal tube assembly (AA18) and HPC air valve signal tube assembly (AA06) as follows.

(a) Remove protective closures.

(b) Lubricate tube nut threads (both tubes) with
R Antiseize Paste P06−054 and install tubes to
solenoid adapters at approximately 10 o'clock
position in intermediate case and to air filters
R attached to Flange J bracket handtight only. Wipe
R off unwanted paste.

(c) Install clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts securing tubes to Flange E bracket, Flange H bracket and HPC case bracket. Torque bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(d) Torque all tube nuts to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

CAUTION: DO NOT USE LUBRICANTS ON EEC SENSING TUBES, ADAPTERS, OR PACKINGS. CONTAMINATION OF EEC CAN RESULT.

(25) For engines with the PT4.95 maintenance break at Flange K (Post SB PW4ENG 73−106), install the EEC PT4.95 tube assembly (AS41) as follows.

(a) Remove protection covers.

(b) Install the tube to the PT4.95 tube (AS01) at 11:00 o'clock position adjacent to Flange K. Tighten by hand.

(c) Install the clamps, bolts, lubricated with Engine Oil P03−001, and nuts that attach the tube to the brackets.

(d) Torque the clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(e) Torque the tube nut at the rear of the tube to 270 − 300 lb−in. (30.506 − 33.895 N.m).

(f) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

CAUTION: DO NOT USE LUBRICANTS ON EEC SENSING TUBES, ADAPTERS, OR PACKINGS. CONTAMINATION OF EEC CAN RESULT.

(26) For basic engines install EEC PT4.95 tube assembly (AS04) as follows.

(a) Remove protective closures.

(b) Position front grommets to inside of intermediate case strut and install tube to grommets. Attach tube to tube coupling at approximately 11:30 o'clock position below intermediate case strut handtight only.

(c) Install clamp, bolt, threads lubricated with Engine Oil P03−001, and nut securing tube to guide at top of intermediate case. Torque bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(d) Torque tube nut to tube coupling below strut to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(27) For engines with the Airbus/McDonnell Douglas common parts configuration, install EEC PT4.95 tube assembly (AS04) as follows.

(a) Remove protection covers.

(b) Position front grommets to inside of intermediate case strut and install tube to grommets. Attach tube to tube coupling at approximately the 11:30 o'clock position below the intermediate case strut hand tight.

(c) Install the (welded) tube clamp to the support assembly that is attached to the guide assembly on the intermediate case. Attach the clamp to the support with a bolt, threads lubricated with Engine Oil P03−001. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View R.

(d) Torque tube nut to tube coupling below strut to 270 − 300 lb−in. (30.506 − 33.895). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

CAUTION: DO NOT USE LUBRICANTS ON EEC SENSING TUBES, ADAPTERS, OR PACKINGS. CONTAMINATION OF EEC CAN RESULT.

(28) For engines not equipped with engine propulsion multiplexer unit (PMUX), install EEC PB tube assembly (AS20) as follows.

(a) Remove protective closures.

(b) Install tube to grommets in intermediate case strut and attach tube to tube coupling below strut at approximately 12:30 o'clock position handtight only.

(c) Install clamp, bolt, threads lubricated with Engine Oil P03−001, and nut securing tube to guide at top of intermediate case. Torque bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(d) Torque tube nut to tube coupling below strut to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

CAUTION: DO NOT USE LUBRICANTS ON EEC SENSING TUBES, ADAPTERS, OR PACKINGS. CONTAMINATION OF EEC CAN RESULT.

(29) For engines equipped with engine propulsion multiplexer unit (PMUX), install EEC PB and PT2.5 sensing tube assembly (AS20/29) as follows.

(a) Remove protective closures.

(b) Install tube to grommets in intermediate case strut and attach two tube nuts to tube couplings below strut at approximately 12:30 o'clock position handtight only.

(c) Install bolt, threads lubricated with Engine Oil P03−001, securing tube to top of intermediate case assembly. Torque bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(d) Torque larger tube nut (PB) below strut to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(e) Torque smaller tube nut (PT2.5) below strut to 135 − 150 lb−in. (15.253 − 16.948 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(30) For engines with the Airbus/McDonnell Douglas common parts configuration, install the EEC PB and PT2.5 sensing tube assembly (AS20/29) as follows.

ENGINE GENERAL − INTERMEDIATE CASE − INSTALLATION−02

(a) Remove protective covers.

(b) Install the tubes to grommets in the intermediate case strut and attach the two tube nuts to tube couplings below the strut at approximately the 12:30 o'clock position and tighten by hand.

(c) Install two clamps and two bolts, threads lubricated with Engine Oil P03−001, and attach the tubes to a bracket on the solenoid switch at the 12:30 o'clock position below the strut. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(d) Install a clamp to the (AS29) tube and attach to a bracket on Flange C at the 12:30 o'clock position with a bolt, threads lubricated with Engine Oil P03−001 and a nut. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View T.

(e) Torque the larger tube nut (PB tube) below the strut to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the tube nut.

(f) Torque the smaller tube nut (PT2.5) below the strut to 135 − 150 lb−in. (15.253 − 16.948 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the tube nut.

NOTE: The welded tube clamp on tubes (AS20/29) at the 12 o'clock position is attached to the guide on the intermediate case with the installation of the W1 harness. See View S.

ENGINE GENERAL - INTERMEDIATE CASE - INSTALLATION-03

Task 72-00-34-450-001:

1. Install Electronic Engine Control (EEC) Speed Transducer (N1)

A. Equipment And Materials Required

Standard Tools:
Glenair TG-70 Strap Wrench or
Glenair TG-69 Soft Jawed Pliers

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-395	Beeswax
P05-396	Paraffin Wax Blend
P06-002	Petrolatum, White (PMC 9609)
P11-009	Alcohol, Denatured Ethyl (AMS 3002)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Key Washer	4	73-23-00/1/40
Key Washer	1	73-23-00/1/75
Packing	2	73-23-00/1/1
Packing	1	73-23-00/1/10

B. Procedure
See Figure 401.

(1) Remove protective closures.

(2) Examine and adjust, if necessary, the gap between the end of the transducer and the rotor as follows.

(a) Apply Beeswax P05-395 or Paraffin Wax Blend P05-396, approximately 0.070 inch (1.778 mm) to flat surface on the small end of the transducer.

(b) Install a Class 1 shim on the lower shoulder of transducer end.

NOTE: Do not install the three packings on the transducer at this time.

CAUTION: INSTALL THE TRANSDUCER WITH THE ELECTRICAL CONNECTOR REARWARD. DO NOT ROTATE THE TRANSDUCER DURING INSTALLATION OR DAMAGE TO THE TRANSDUCER OR ENGINE CAN RESULT.

(c) Temporarily install the spring−loaded speed transducer into the opening in the intermediate case at approximately 5 o'clock position with the electrical connector rearward.

(d) Lubricate the bolts and nut (if equipped with the locating stud, Post SB PW4ENG 73−88) with Engine Oil P03−001. Temporarily install the washers, bolts, and nut (if equipped). Tighten evenly and engage the transducer to the case completely. Torque the bolts and nut (if equipped) to 85 lb−in. (9.604 N.m). Be sure you engage the transducer to the case completely.

(e) Slowly turn the fan rotor approximately 15 degrees counterclockwise as viewed from the front of the engine.

(f) Loosen the bolts and nut (if equipped) and remove the transducer from the engine.

(g) (Reference 775) Carefully cut a section of wax away from the end of the transducer and the measure thickness of the wax remaining in the area of the deepest impression. If the result is between 0.020 − 0.050 inch (0.508 − 1.270 mm), the proper shim is installed.

(h) If the result is smaller than 0.020 inch (0.508 mm), replace the Class 1 shim with a Class 2 shim.

(i) If the result is greater than 0.050 inch (1.270 mm), remove the Class 1 shim.

(j) Remove all the wax from the end of transducer.

(3) Install two new packings, lubricated with Engine Oil P03−001, to the grooves in the shaft of the transducer. Install one new packing, lubricated with White Petrolatum P06−002, to the groove in the transducer flange. Be sure the correct shim (if required) is installed on the transducer.

CAUTION: INSTALL THE TRANSDUCER WITH THE ELECTRICAL CONNECTOR REARWARD. DO NOT ROTATE THE TRANSDUCER DURING INSTALLATION OR DAMAGE TO THE TRANSDUCER OR ENGINE CAN RESULT.

(4) Carefully reinstall the transducer in the intermediate case with the electrical connector rearward.

(5) For engines with the No. 1 bearing vibration transducer cable bracket, install the bracket to the forward two holes. Attach the transducer as follows. See Figure 401, (Sheet 2).

CAUTION: YOU MUST USE KEY WASHERS WITH CASES THAT DO NOT HAVE SELF−LOCKING INSERTS IN THE INTERMEDIATE CASE BOSS.

(a) Lubricate the bolts with Engine Oil P03−001.

(b) Install the bolts and washers (key washers for engines without self−locking inserts) that attach the transducer. Tighten evenly by hand.

NOTE: Use the longer bolts at the bracket location if equipped.

(c) For engines with the locating stud, install the key washer and nut, lubricated with Engine Oil P03−001. Tighten by hand.

(d) Torque (as equipped)
- the bolts without the self−locking insert feature to 65 − 85 lb−in. (7.344 − 9.604 N.m).
- the bolts with the self−locking insert feature to 85 − 95 lb−in. (9.604 − 10.734 N.m).
- the nut on the locating stud to 150 − 170 lb−in. (16.948 − 19.207 N.m).

(e) Bend the key washer tabs if used.

(6) If equipped, install the clamp and bolt, lubricated with Engine Oil P03−001, and attach the No. 1 bearing vibration transducer cable to the bracket. Torque the clamp bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(7) Connect the W4P19 harness connector to the transducer harness receptacle as follows.

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is hand tight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 Strap Wrench or the Glenair TG−69 Soft−Jawed Pliers and tighten the connector coupling nut. Use sufficient force to be sure:
− the connector coupling nut is fully tight
− the connector fits tightly against the receptacle (metal to metal).

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

C. Postrequisites

(1) Install the fan exit liner segment (inner rear) that is at 5 o'clock. Refer to 72−00−33, Installation−16 Task 72−00−33−440−001.

(2) Test engine per Test Reference Table. See 71−00−00, Testing−00 Task 71−00−00−990−003.

EEC Speed Transducer (N1) Installation (Attaching Parts)
Figure 401 (Sheet 2)
(Task 72−00−34−450−001)

Task 72−00−34−450−002:

1. Install No. 1 Bearing Support (Front And Rear) Assembly

NOTE: See Figure 401 for part/assembly installation procedure sequence.

A. Prerequisites

(1) See Inspection/Check−01 Task 72−00−34−990−001 for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Required

Special Tools:
CTE 5070 Cart, Airflow (Optional To CTE 6070)
CTE 6070 Cart, Airflow
PWA 85367 Adapter, Handling
PWA 85368 Arm, Lifting
PWA 85564 Adapter

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)
P05−289	Lockwire (AS3214−02)
P05−291	Cable, Safety (Optional)
P05−292	Ferrule, Safety Cable (Optional)
P06−002	Petrolatum White (PMC 9609)
P06−054	Antiseize Paste (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing (Optional)	1	72−34−00/1/30
Packing	1	72−34−00/1/40
Packing	1	79−21−00/11/1
Retainer	1	79−21−00/11/10

C. Procedure
See Figure 402.

CAUTION: IF NO. 1 BEARING REAR SUPPORT ASSEMBLY PN 50A639 IS USED, THEN NO. 1 BEARING FRONT SUPPORT PN 50A641 MUST BE USED ALSO.

CAUTION: IF NO. 1 BEARING FRONT SUPPORT PN 50A452 IS USED THEN NO. 1 BEARING REAR SUPPORT ASSEMBLY PN 50A566 MUST BE USED ALSO.

CAUTION: NO. 1 BEARING FRONT SUPPORT PN 50A641 MAY BE USED WITH NO. 1 BEARING REAR SUPPORT ASSEMBLY PN 50A566.

(1) Install front support, bolt flange down, in oven that does not exceed 300°F (148.9°C).

(2) Install packing, lubricated with Petrolatum White P06−002, to groove in front flange of rear support.

(3) Remove front support from oven using protective gloves, and position over rear support. Align offset hole at approximately 1:00 o'clock and push to seat on rear support.

(4) Carefully install 34 bolts, threads lubricated with Engine Oil P03−001, washers, and nuts. Torque nuts to 180 − 200 lb−in. (20.337 − 22.597 N.m). Allow parts to cool to touch and recheck torque.

(5) Install No. 1 bearing (oil) pressure manifold in No. 1 bearing rear support assembly.

  (a) Install in the bracket (402/1) the pin that is at end of the manifold.

  (b) Lubricate threads of two bolts with Engine Oil P03−001. Secure flange of manifold to bracket (402/2) with two bolts and two nuts. Torque to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(6) Install suitable aligning pins to engine bolt flange.

(7) Trunnion support assembly to front end down and install packing, lubricated with Engine Oil P03−001, to groove in rear flange of rear support.

(8) Attach PWA 85368 Arm to PWA 85367 Adapter and, using hoist, raise support to front of engine.

(9) Install support to engine, aligning pressure manifold with pressure tube connector and with offset hole at approximately 11 o'clock in intermediate case. Install 46 bolts, threads lubricated with Engine Oil P03-001, and washers to secure support assembly. Remove alignment pins. Install remaining bolts and washers.

(10) Tighten and torque bolts to 290 - 325 lb-in. (32.766 - 36.720 N.m).

(11) Remove hoist, arm, and adapter from support.

(12) Airflow check No. 1, 1.5, and 2 bearing oil nozzles. See Figure 403.

  (a) Remove main bearing oil pressure tube assembly (LP05).

    1 Remove lockwire and disconnect tube from adapter on last chance strainer housing at approximately 9:30 o'clock position at Flange E.

    2 Remove lockwire and disconnect tube nut from fuel/oil cooler adapter at approximately 9 o'clock position.

    3 Remove bolt and clamp securing tube to Flange E bracket and remove tube from engine.

    4 Remove and discard retainer and packing. Install protective closures on fuel/oil cooler adapter.

  (b) Perform airflow check.

    1 Install PWA 85564 Adapter in the last chance strainer housing.

    2 Secure air supply hose from CTE 6070 or CTE 5070 Airflow Cart to larger threaded hole of adapter. Secure the pressure sensing line of the airflow cart to smaller threaded hole in adapter.

3 Airflow check nozzles at 10 psig (68.9 kPa). The airflow value at this check must be within ± 2.0 lb/hr (0.91 kg/hr) of the base airflow value.

NOTE: If this module has the same oil nozzles as before, use the base airflow value that you got before you disassembled the module. Refer to 72−00−34, Removal−02
R (Task 72−00−34−020−002).

NOTE: If this module does not have the same oil nozzles as before, use the base airflow value that you got after you did the oil flow. Refer to 72−34−00, Testing−02 Task 72−34−00−720−001.

NOTE: The airflow value that is for test equipment and reference only is 40 − 57 lb/hr (18.14 − 25.85 kg/hr).

4 Remove the adapter and cart.

(c) Reinstall main bearing oil pressure tube assembly (LP05).

1 Remove protective closure.

2 Install new packing, lubricated with Engine Oil P03−001, and retainer to rear of tube.

3 Lubricate tube nut threads at both ends with Antiseize Paste P06−054. Wipe off unwanted paste. Install tube to last chance strainer housing adjacent to Flange E and to adapter above fuel/oil cooler handtight only.

4 Install clamp and bolt, threads lubricated with Engine Oil P03−001, securing tube to Flange E bracket. Torque bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

5 Torque forward tube nut to strainer housing to 675 − 750 lb−in. (76.265 − 84.739 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

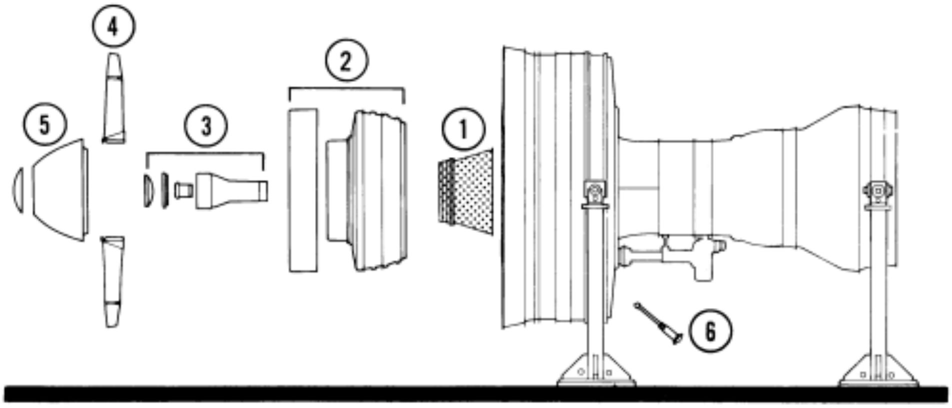
6 Torque rear tube nut to 140 - 160 lb-in. (15.818 - 18.087 N.m). Loosen tube nut, then retorque to required limit. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(13) Install the No. 1 bearing vibration transducer. Refer to 72-00-34, Installation-22 (Task 72-00-34-440-001).

D. Postrequisites

(1) Install low pressure compressor (LPC). See 72-00-31, Installation-01 Task 72-00-31-420-003.

(2) Test engine per Test Reference Table. See 71-00-00, Testing-00 Task 71-00-00-990-003.



1. INSTALL NO. 1 BEARING SUPPORT ASSEMBLY.
2. INSTALL LOW PRESSURE COMPRESSOR (LPC).
3. INSTALL LPC/LPT COUPLING.
4. INSTALL STAGE 1 LPC BLADE ASSEMBLIES.
5. INSTALL COMPRESSOR INLET CONE.
6. INSTALL ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).

ENGINE GENERAL - INTERMEDIATE CASE - INSTALLATION-05

Task 72-00-34-990-002:

1. Install EEC Fan Case Wiring Harnesses W1 And W2 - Relocated

Installation Of EEC Fan Case Wiring Harnesses W1 And W2, Has Been Relocated To 72-00-33, Installation-06.

Task 72-00-34-450-003:

2. Install EEC Core Engine Wiring Harnesses W3, W4 And W5 - Relocated

Installation Of EEC Core Engine Wiring Harnesses W3, W4, And W5, Has Been Relocated To 72-00-34, Installation-18, Installation-19 And Installation-20 Respectively.

Task 72-00-34-430-001:

1. Install No. 1.5 Bearing Support Assembly
   A. Equipment And Materials Required

      Special Tools:
      PWA 29855-3 Pin (2 Necessary)
      PWA 85366 Adapter, Handling (Optional to PWA 87316)
      PWA 85368 Arm, Lifting
      PWA 87316 Adapter, Handling
      PWA 87514 Gage, Plug

      Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

      Expendable Parts:

   B. Procedure
      (1) If there are workbolts in the intermediate case at Flange E, remove them.

         CAUTION: BE SURE TO USE THE CORRECT PART NUMBER PRESSURE TUBE. INTERCHANGEABILITY IS AFFECTED. REFER TO SB PW4ENG 72-179.

      (2) Install the No. 2 bearing (oil) pressure tube (Pre SB PW4ENG 72-394) or oil shut-off valve (Post SB PW4ENG 72-394) in the No. 2 bearing housing. See Figure 401.
         (a) For engines that are Pre SB PW4ENG 72-179, install the tube.
         (b) For engines that are Post SB PW4ENG 72-179:
            1 Apply Engine Oil (P03-001) to two packings.
            2 Install the packings on the tube/valve.
            3 Install the tube/valve.

Installation Of The No. 2 Bearing
(Oil) Pressure Tube
Figure 401
(Task 72−00−34−430−001)

CAUTION: BE SURE TO USE THE CORRECT PART NUMBER TUBE CONNECTOR. INTERCHANGEABILITY IS AFFECTED. REFER TO SB PW4ENG 72−179.

(3) Install the main bearing tube connector assembly (called (tube connector) on the No. 1.5 bearing support assembly (called support) as follows. See Figure 402.
  (a) (Pre SB PW4ENG 72−179) If not installed, install a seal ring, lubricated with Engine Oil (P03−001), on the tube connector.
  (b) (Post SB PW4ENG 72−179) Install a packing, lubricated with Engine Oil (P03−001), on the tube connector.
  (c) Install the tube connector in the connector that is installed on the support. Push the tube connector into the connector that is on the support.

(4) Install the No. 1.5 bearing support assembly in the intermediate case assembly. See Figure 403.
  (a) Install PWA 29855−3 Pins in the threaded holes in rear ID of the intermediate case at 2 and 10 o'clock.
  (b) Attach PWA 85366 Adapter to the front flange of the support assembly with four hex head bolts.
  (c) Attach PWA 85368 Arm to the threaded rod at the center of the adapter.
  (d) Attach a hoist to the arm and raise the support assembly.

  CAUTION: BE CAREFUL NOT TO HIT THE NO. 2 BEARING (OIL) PRESSURE TUBE WHEN YOU INSTALL THE SUPPORT ASSEMBLY.

  (e) Apply Engine Oil (P03−001) to the threads of 33 bolts. Attach the support assembly with the bolts.
  (f) Torque the bolts to 180 − 200 lb−in. (20.337 − 22.597 N.m).
  (g) Remove the arm, adapter, and pins.

(5) Attach the tube connector to the tube flange on the intermediate case. See Figure 402.

  (a) Lubricate with Engine Oil (P03−001) the threads of three bolts.
  (b) Put a gasket on the tube flange.
  (c) Move the tube connector to mate with the gasket and tube assembly.

Figure 403
(Task 72−00−34−430−001)

    - (d) Attach the tube connector and gasket to the tube assembly with three washers and the three bolts. Torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).
- (6) Install the main bearing (inner) scavenge tube assembly. See Figure 402.
    - (a) Apply Engine Oil (P03-001) to the threads of three bolts.
    - (b) Put the gasket on the tube flange at 7:30 o'clock.
    - (c) Attach the tube assembly to the intermediate case with the three bolts. Torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).
    - (d) Put a clamp on the tube assembly.
    - (e) Apply Engine Oil (P03-001) to the threads of one screw.
    - (f) Attach the clamp to the bracket with the screw. Torque the screw to 36 - 40 lb-in. (4.067 - 4.519 N.m).
    - (g) Apply Engine Oil (P03-001) to the threads of a bolt. Attach the bracket to the support assembly with the bolt and a nut. Torque the bolt to 85 - 95 lb-in. (9.604 - 10.734 N.m).
- (7) Install angle gearbox parts. See Figure 404.
    - (a) Apply Engine Oil (P03-001) to the splines of the gearbox driveshaft. Install the gearbox driveshaft. Mate the splines. Install the retaining ring.
    - (b) Do a check of the installation of the gearbox driveshaft retaining ring as follows.
        - 1 Install PWA 87514 Gage in the bore of the bevel gear.
        - 2 If the retaining ring is correctly installed, the detail stop bar will touch the bottom of the bevel gear.
    - (c) Install the plug (gearbox cover).
        - 1 Apply Engine Oil (P03-001) to a packing.
        - 2 Install the packing on the plug (gearbox cover).
        - 3 Install the plug (gearbox cover) in the angle gearbox.
        - 4 Install the retaining ring.

C. Postrequisites

- (1) Install the No. 1 bearing support assembly. See Installation-04 (Task 72-00-34-450-002).

ENGINE GENERAL − INTERMEDIATE CASE − INSTALLATION−07

Task 72−00−34−430−002:

1. Install The 4th Stage Compressor Stator Assembly

A. Equipment And Materials Required

Special Tools:

PWA 85905 Fixture Assemble/Disassemble

Consumable Materials:

	Item No.	Designation
	P03−001	Oil, Engine (PWA 521B)
R R	P06−053	Lubricant, Sealing Ring (PWA 36500)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	72−34−00/12/40
Packing	1	72−34−00/12/140

B. Procedure
See Figure 401.

R R (1) Apply Engine Oil P03−001 or Sealing Ring Lubricant P06−053 to the stator assembly packings.

(2) Put the packings in the grooves on the front and rear OD of the stator assembly.

(3) Assemble PWA 85905 Fixture.

(a) Put the jaw marked "install" on the tool 1.5 inch (38.100 mm) from the body.

(b) Make the quantity of threads the same at both ends of the screw.

(4) Put the stator assembly against the intermediate case. The dowel pin in the rear of the stator assembly will engage the offset hole at 12 o'clock. Rotate the stator assembly to partially engage the tabs of the intermediate case.

ENGINE GENERAL − INTERMEDIATE CASE − INSTALLATION−07

(5) At 11 o'clock, engage the fixture in the tabs of the stator assembly and the intermediate case. Turn the screw of the fixture to fully engage the tabs of the stator assembly and intermediate case.

(6) Apply Engine Oil P03−001 to the threads of 24 bolts.

(7) Attach the stator assembly to the intermediate case with washers and the 24 bolts. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(8) Remove the fixture.

C. Postrequisites

(1) Install the fan exit liner segment (inner rear) that is at 11 or 1 o'clock. Refer to 72−00−33, Installation−16 Task 72−00−33−440−001.

(2) Install low pressure compressor (LPC). See 72−00−31, Installation−01 Task 72−00−31−420−003.

Task 72−00−34−450−004:

1. Install Air/Oil Heat Exchanger And Valve (IDGS)

A. Equipment And Materials Necessary

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 85853	Adapter, Torque
PWA 87505	Positioner
PWA 102285	Adapter, Torque

Consumable Materials:

	Item No.	Designation
	P03−001	Oil, Engine (PWA 521B)
	P05−289	Lockwire (AS3214−02)
	P05−291	Cable, Safety (Optional)
	P05−292	Ferrule, Safety Cable (Optional)
	P05−395	Beeswax
	P05−396	Paraffin Wax Blend
	P06−002	Petrolatum, White (PMC 9609)
R	P06−054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	24−11−00/1/6
Packing	1	24−11−00/2/70

B. Procedure

See Figure 401 (Sheet 1), Figure 401 (Sheet 2) and Figure 401 (Sheet 3).

NOTE: Items referred to as numbers in parenthesis in text are identified in Figure 401.

CAUTION: DO NOT HANDLE HEAT EXCHANGER VALVE AND HEAT EXCHANGER BY INLET COLLARS. INLET COLLARS ARE NOT INTEGRAL PARTS OF THE VALVE HOUSING.

(1) Remove protective closures.

(2) (Pre SB PW4ENG 79−60), Make sure the four inboard bolts (401/10) and washers (401/9) are installed loosely to the rear of the intermediate case as follows.

(a) Make sure the four bolts (401/10), threads lubricated with Engine Oil P03−001, and washers (401/9) are installed loosely in the four inboard bolt holes. Make sure the washers are sealed to the boltheads with Beeswax P05−395 or Paraffin Wax Blend P05−396.

(3) (Post SB PW4ENG 79−60), Make sure the four inboard bolt and washer assemblies are loosely installed in the rear of the intermediate case.

(4) Set the height of the bolts/bolt and washer assemblies with a PWA 87505 Positioner .

(5) Install and position air/oil heat exchanger (401/22) and valve in intermediate case, aligning inboard slotted holes in valve ducts with four bolts installed in intermediate case.

CAUTION: BE CERTAIN TO USE SHORTER BOLTS (SAME AS REMOVED) TO SECURE BRACKETS (UPPER AND LOWER TO AIR/OIL HEAT EXCHANGER AND VALVE OR DAMAGE TO UNIT MAY RESULT.

(6) Secure upper bracket (401/6) to heat exchanger and to bracket (401/26) on intermediate case with four bolts (401/5, 401/7), threads lubricated with Engine Oil P03−001, handtight only.

(7) Secure lower bracket (401/13) to heat exchanger and to bracket (401/16) attached to intermediate case with four bolts (401/14, 401/15), threads lubricated with Engine Oil P03−001, handtight only.

(8) Secure bracket (401/24) on forward side of valve to intermediate case with two bolts (401/11), threads lubricated with Engine Oil P03−001, and washers (401/12), handtight only.

(9) (Pre SB PW4ENG 79−60), Attach the valve inlet collars to the rear of the intermediate case as follows.

R
R

(a) Install four outboard bolts (401/10), threads lubricated with Engine Oil P03−001, and washers (401/9) in the outboard holes. Tighten by hand the four inboard bolts that were installed before and the four outboard bolts.

(10) (Post SB PW4ENG 79−60), Attach the valve inlet collars to the rear of the intermediate case as follows.

(a) Install four bolt and washer assemblies, threads lubricated with Engine Oil P03−001, in the outboard bolts holes. Tighten by hand the four inboard bolt and washer assemblies that were installed before and four outboard bolt and washer assemblies.

CAUTION: WITH THE PWA 85853TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING (SEE STANDARD PRACTICES MANUAL, 70−00−00). TOO MUCH TORQUE CAN DAMAGE THE THREADED PARTS.

(11) Torque previously installed bolts (401/5, 401/7, 401/14 and 401/15) bolts with PWA 102285 Torque Adapter to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(12) Torque previously installed bolt (401/10 and 401/11) and washer assemblies with PWA 85853 Torque Adapter to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(13) Install airframe cooler outlet oil tube (upper right) (LS03) (401/30) as follows:

(a) Remove protective closures.

(b) Install packing (401/29) lubricated with Engine Oil P03−001, into groove on collar end of tube.

(c) Install tube, securing swivel collar (401/28) to heat exchanger with three bolts (401/27), threads lubricated with Engine Oil P03−001. Tighten bolts handtight.

(d) Lubricate tube coupling nut (401/31) threads with
R Antiseize Paste P06−054 and connect tube nut to
R the tube coupling. Wipe off unwanted paste.
Tighten nut handtight.

(e) Torque three previously installed bolts (401/27), securing tube swivel collar to heat exchanger, to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(f) Torque tube coupling nut (401/31) to 675 − 750 lb−in. (76.265 − 84.739 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 the nut.

CAUTION: MAKE SURE YOU CONNECT THE TUBE TO THE CORRECT CONNECTOR OR FAULT MESSAGES WILL BE GENERATED.

(14) Connect air/oil cooler valve return tube (CR12) (401/17).

R R (a) Lubricate tube nut threads with Antiseize Paste P06−054. Wipe off unwanted paste. Install the CR12 tube to the adapter that is furthest from the lower triangular pad on the exchanger.

(b) (Reference 256) Torque tube nut to 140 − 160 lb−in. (15.818 − 18.078 N.m.). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

NOTE: Hold bulkhead adapter with wrench while tightening tube nut at heat exchanger.

CAUTION: MAKE SURE YOU CONNECT THE TUBE TO THE CORRECT CONNECTOR OR FAULT MESSAGES WILL BE GENERATED.

(15) Connect air/oil cooler valve hydraulic tube (CP13) (401/18).

R R (a) Lubricate tube nut threads with Antiseize Paste P06−054. Wipe off unwanted paste. Install the CP13 tube to the adapter that is closest to the lower triangular pad on the exchanger. Connect tube nut to heat exchanger adapter.

(b) (Reference 256) Torque tube nut to 140 − 160 lb−in. (15.818 − 18.078 N.m.). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

NOTE: Hold bulkhead adapter with wrench while tightening tube nut at heat exchanger.

(16) Remove protective closure. Install valve cable receptacle to bracket on stator vane actuator support (401/22), aligning holes in receptacle flange with holes in bracket. Secure connector with two bolts (401/20) threads lubricated with Engine Oil P03−001 and harness bracket (401/21). Torque bolts (401/20) to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(17) Install clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts securing harness to air/oil cooler valve return tube (401/17). Torque clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

C. Postrequisites

(1) Install the fan exit liner segment (inner rear) that is at 4 o'clock. Refer to 72−00−33, Installation−16 Task 72−00−33−440−001.

(2) Test engine by Test Reference Table. See 71−00−00, Testing−00 Task 71−00−00−990−003.

Air/Oil Heat Exchanger And Valve (IDGS)
Figure 401 (Sheet 3)
(Task 72-00-34-450-004)

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72-00-34-450-005:

1. Install Valve To Air/Oil Heat Exchanger (IDGS)

A. Equipment And Materials Necessary

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 102285	Adapter, Torque

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
R	P05-292	Ferrule, Safety Cable (Optional)
R	P06-053	Lubricant, Sealing Ring (PWA 36500)
	P06-054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing (Pre SB PW4ENG 24-4)	1	24-11-00/1/190
Packing	2	24-11-00/1/210
Packing, MS9966-04	2	(Post SB PW4ENG 24-4)

B. Procedure
See Figures 401, 402 and 403.

NOTE: Items referred to parenthesis in the text are identified in the figures.

CAUTION: DO NOT LIFT THE HEAT EXCHANGER VALVE AND/OR HEAT EXCHANGER BY THE INLET COLLARS. THE INLET COLLARS ARE NOT AN INTEGRAL PART OF THE VALVE HOUSING.

(1) Place the air/oil heat exchanger valve on the bench with the two four hole ducts downward and the three end ports facing the operator.

(2) Place the air/oil heat exchanger on the valve with the three hole tube bracket toward the operator.

(3) Secure heat exchanger and drain tube bracket to the valve with bolts, threads lubricated with Engine Oil P03-001, washers (under bolt heads and nuts) and nuts. Omit a washer at the bracket location. Torque the nuts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(4) If a new valve is to be installed, comply with the following:

(a) For Pre SB PW4ENG 24-4: Install a packing, lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 on the smaller adapter. Lubricate the adapter threads with Engine Oil P03-001 and install the adapter in the smaller port of the three ports at the end of the valve. Torque the adapter to 65 - 75 lb-in. (7.344 - 8.474 N.m).

(b) For Post SB PW4ENG 24-4: Lubricate a packing with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 and install it on the smaller adapter. Lubricate the adapter threads with Engine Oil P03-001. Locate the angled port (SO OVERBOARD DRAIN) at the end of the valve and install the adapter into the port. Torque the adapter to 65 - 75 lb-in. (7.344 - 8.474 N.m).

NOTE: The end of the valve with the angled port is opposite the three port end of valve.

(c) For Post SB PW4ENG 24-4: Lubricate the packing with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 and install on the plug. Lubricate the plug thread with Engine Oil P03-001 and install the plug in the smaller port of the three ports at the end of the valve. Torque the plug to 65 - 75 lb-in. (7.344 - 8.474 N.m).

(d) Install the packings lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053, on the two larger adapters. Lubricate the adapter threads with Engine Oil P03-001 and install the adapters in two remaining ports. Torque the adapters to 110 - 120 lb-in. (12.428 - 13.558 N.m).

(e) Install the air shut off valve drain tube (CR10) as follows.

1 (Pre SB PW4ENG 79-49) Lubricate the threads of the smaller adapter with Antiseize Paste P06-054, and attach the tube to the adapter and to the hole in tube flange on the heat exchanger. Wipe off unwanted paste. Secure the coupling on the tube to the heat exchanger with a jamnut, threads lubricated with Engine Oil P03-001.

2 (Post SB PW4ENG 79-49) Lubricate the threads of the smaller adapter with Antiseize Paste P06-054, and attach the tube to the adapter and to the hole in tube flange on the heat exchanger with a plate between flats on the tube and the flange. Wipe off unwanted paste. Lubricate the threads on the coupling end of the tube with Engine Oil P03-001 and secure it with a washer and a jamnut.

3 Torque tube nut to 90 - 100 lb-in. (10.169 - 11.298 N.m). Torque the jamnut to 70 - 80 lb-in. (7.909 - 9.039 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 the tube nut and the jamnut.

(f) Install the air/oil cooler valve return tube (CR11) and the air/oil cooler valve hydraulic tube (CP09) as follows.

1 (Pre SB PW4ENG 79-49) Lubricate the threads on the remaining adapters with Antiseize Paste P06-054. Wipe off unwanted paste. Attach the tubes to the remaining adapters, with the couplings on the tubes through the flange on the heat exchanger. Lubricate the threads on the couplings with Engine Oil P03-001 and secure them with jamnuts.

2 (Post SB PW4ENG 79-49) Lubricate the threads on the remaining adapters with Antiseize Paste P06-054. Wipe off unwanted paste. Attach the tubes to the remaining adapters, with the couplings on the tubes through the plate and the flange on the heat exchanger. Lubricate the threads on the couplings with Engine Oil

P03-001 and secure them to the tubes with washers and the jamnuts.

NOTE: (Post SB PW4ENG 24-7) New CP09 and CR11 tubes with revised clamping were introduced to raise the natural frequency of these tubes well above the engine operating range.

NOTE: (Post SB PW4ENG 24-9) Further modified CP09 and CR11 tubes and tube clamping were provided to better align and fit the tubes than those introduced on SB PW4ENG 24-7.

NOTE: (Post SB PW4ENG 24-10) Further modified CR11 tube to correct the SB PW4ENG 24-9 tube data requirements to eliminate the possibility of a tube chafe against the intermediate case centerbody when the IDG air oil cooler is installed.

3 Torque the tube nuts to 200 - 225 lb-in. (22.597 - 25.422 N.m). Torque the jamnuts to 70 - 80 lb-in. (7.909 - 9.039 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 the tube nuts and the jamnuts.

NOTE: If the tubes, clamps, bolts and nuts which secure the tubes have been removed, clamp the tubes together as shown in the Figure 403 (Sheets 1 or 9 as applicable).

(5) If a new heat exchanger is to be installed, comply with the following:

(a) Install the upper and lower mount brackets to the heat exchanger. Secure the brackets with bolts, threads lubricated with Engine Oil P03-001. Torque the bolts with PWA 102285 Torque Adapter to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(6) Secure the air shutoff valve drain tube clamp to the cable shield with a bolt, threads lubricated with Engine Oil P03-001. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

C. Postrequisites

(1) Install Air/Oil Heat Exchanger And Valve (IDGS) to engine per Removal/Installation−01 (Task 72−00−34−450−004).

(Task 72−00−34−450−005)

Task 72-00-34-450-006:

1. Install Air/Oil Heat Exchanger And Valve (Engine)

A. Equipment And Materials Necessary

Standard Tools:
Glenair TG-70 Strap Wrench or
Glenair TG-69 Soft Jawed Pliers
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 85853	Adapter, Torque
PWA 87505	Positioner
PWA 102285	Adapter, Torque

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
	P05-292	Ferrule, Safety Cable (Optional)
	P05-395	Beeswax
	P05-396	Paraffin Wax Blend
R	P06-053	Lubricant, Sealing Ring (PWA 36500)
R	P06-054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	2	79-21-00/3/4
Packing	3	79-21-00/8/1

CAUTION: DO NOT HANDLE HEAT EXCHANGER VALVE AND HEAT EXCHANGER BY INLET COLLARS. INLET COLLARS ARE NOT INTEGRAL PARTS OF THE VALVE HOUSING.

B. Procedure

See Figure 401.

NOTE: Items referred to as numbers in parenthesis in text are identified in Figure 401.

(1) (Pre SB PW4ENG 79-60), Make sure the four inboard bolts (401/23) and washers (401/24) are installed loosely to the rear of the intermediate case as follows.

(a) Make sure the four bolts (401/23), threads lubricated with Engine Oil P03-001, and washers (401/24) are installed loosely in the four inboard bolt holes. Make sure the washers are sealed to the boltheads with Beeswax P05-395 or Paraffin Wax Blend P05-396.

(2) (Post SB PW4ENG 79-60), Make sure the four inboard bolt and washers assemblies are loosely installed in the rear of the intermediate case.

(3) Set the height of the bolts/bolt and washer assemblies with a PWA 87505 Positioner.

(4) Remove protective closures.

(5) Ensure detail packings are installed to inlet collars.
R If the packings are not installed, install the new
R packings, lubricated with Engine Oil P03-001 or Sealing
R Ring Lubricant P06-053 to the inlet collars. See
R Figure 401.

(6) Install air/oil heat exchanger (401/22) and valve (bottom end in first) to intermediate case. Rotate top of heat exchanger and valve inward and allow to drop slightly.

CAUTION: BE CERTAIN TO USE SHORTER BOLTS (SAME AS REMOVED) TO SECURE BRACKETS (UPPER AND LOWER) TO AIR/OIL HEAT EXCHANGER AND VALVE OR DAMAGE TO UNIT MAY RESULT.

(7) Secure (upper) bracket (401/25) to heat exchanger and valve with two bolts (401/27), threads lubricated with Engine Oil P03-001. Torque bolts (401/27), with PWA 102285 Torque Adapter to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(8) Raise heat exchanger and valve to engage inlet collars to previously installed inboard bolts (401/23) and washers (401/24) bolt and washer assemblies.

(9) Secure upper bracket (401/25) on heat exchanger to bracket (401/5) on intermediate case with two bolts (401/26), threads lubricated with Engine Oil P03-001. Tighten bolts handtight.

(10) Install previously removed lower bracket (401/9) to heat exchanger. Secure bracket with two bolts (401/15), threads lubricated with Engine Oil P03-001. Torque bolts (401/15), with PWA 102285 Torque Adapter to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(11) Secure lower bracket (401/9) to bracket (401/11) on intermediate case with two bolts (401/17) threads lubricated with Engine Oil P03-001. Tighten bolts handtight.

(12) Secure bracket on forward side of valve to intermediate case with two bolts (401/8), lubricated with Engine Oil P03-001, and washers (401/7). Tighten bolts handtight.

(13) (Pre SB PW4ENG 79-60), Attach the valve inlet collars to the rear of the intermediate case as follows.

- (a) Install four outboard bolts (401/23), threads lubricated with Engine Oil P03-001, and washers (401/24) in the outboard holes. Tighten by hand the four inboard bolts that were installed before and the four outboard bolts.

(14) (Post SB PW4ENG 79-60), Attach the valve inlet collars to the rear of the intermediate case as follows.

- (a) Install four bolt and washer assemblies, threads lubricated with Engine Oil P03-001, in the outboard bolts holes. Tighten by hand the four inboard bolt and washer assemblies that were installed before and four outboard bolt and washer assemblies.

CAUTION: WITH THE PWA 85853 TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING (SEE STANDARD PRACTICES MANUAL, 70-00-00). TOO MUCH TORQUE CAN DAMAGE THE THREADED PARTS.

(15) Torque previously installed bolts (401/17 and 401/26) bolts with PWA 102285 Torque Adapter to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(16) Torque previously installed bolt (401/8 and 401/23) and washer assemblies with PWA 85853 Torque Adapter to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(17) Secure rear end of cable conduit to lower bracket (401/11) on intermediate case with bolts (401/14, 401/16), threads lubricated with Engine Oil P03-001. Torque bolts (401/14, 401/16), with PWA 102285 Torque Adapter to 36 - 40 lb-in. (4.067 - 4.519 N.m).

CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTION USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF THE TUBE OR AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE EXTERNAL WIRE BRAID AND IN THE INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(18) Install air cooler outlet oil hose and tube assembly (LP03) (401/28).

(a) Remove protective closures.

(b) Install new packing, lubricated with Engine Oil P03-001, in groove at flanged end.

(c) Secure flange with bolts, threads lubricated with Engine Oil P03-001 handtight only.

(19) Install air cooler inlet oil tube (LP02) (401/29).

(a) Remove protective closures.

(b) Install new packing, lubricated with Engine Oil P03-001, in groove adjacent to flange.

(c) Install new packing, lubricated with Engine Oil P03-001, on elbow end of tube.

(d) Install tube, flange end, to air cooler. Secure flange with bolts, threads lubricated with Engine Oil P03-001.

(e) Secure elbow end of tube to oil filter housing with three bolts, threads lubricated with Engine Oil P03-001.

(f) Torque bolts at each end of tube to 85 - 95 lb-in. (9.604 - 10.734 N.m) including outlet tube flange bolts.

(g) Install bolt, threads lubricated with Engine Oil P03-001, and nut securing W3/W5 harness clamp and bracket installed on tube. Torque bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(20) Install air/oil cooler valve hydraulic return tube (CR05) (401/19).

(a) Lubricate tube nut threads with Antiseize Paste P06-054. Wipe off unwanted paste. Connect tube to heat exchanger (401/22) adapter.

(b) Torque tube nut to 200 - 225 lb-in. (22.597 - 25.422 N.m).

NOTE: Hold bulkhead adapter with wrench while tightening tube nut at heat exchanger.

(c) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 the tube nut.

(21) Install air/oil cooler valve hydraulic tube (CP07) (401/18).

(a) Lubricate tube nut threads with Antiseize Paste P06-054. Wipe off unwanted paste. Connect tube to heat exchanger (401/22) adapter.

(b) Torque tube nut to 200 - 225 lb-in. (22.597 - 25.422 N.m).

NOTE: Hold bulkhead adapter with wrench while tightening tube nut at heat exchanger.

(c) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 the tube nut.

(22) Remove protective closure and install valve cable flanged receptacle to HPC case bracket. Secure with harness bracket and two bolts (401/20), threads lubricated with Engine Oil P03-001. Torque bolts (401/20) to 36 - 40 lb-in. (4.067 - 4.519 N.m).

R
R

(23) Connect the W3P17 harness connector to the heat exchanger and valve harness receptacle as follows.

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make
R straight all the bent pins. If necessary, clean
R the connector and receptacle by SPOP 6 (Task
R 70−21−00−110−900). Refer to Section 70−21−00 in
R the Standard Practices Manual, PN 585005.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 strap wrench or the Glenair TG−69 soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal). This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

C. Postrequisites

(1) Install the fan exit liner segment (inner rear) that is at 8 o'clock. Refer to 72−00−33, Installation−16 Task 72−00−33−440−001.

(2) Test engine per Test Reference Table. See 71−00−00, Testing−00 Task 71−00−00−990−003.

(Task 72−00−34−450−006)

Task 72-00-34-450-007:

1. Install Valve To Air/Oil Heat Exchanger (Engine)

A. Equipment And Materials Necessary

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 102285	Adapter, Torque

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
R	P05-292	Ferrule, Safety Cable (Optional)
R	P06-053	Lubricant, Sealing Ring (PWA 36500)
	P06-054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	79-21-00/3/30
Packing	2	79-21-00/3/50

Lockwire, AS3214-02

B. Procedure
See Figure 401, Figure 402 and Figure 403.

NOTE: Items referred to in parenthesis in the text are identified in the figures.

CAUTION: DO NOT HANDLE THE HEAT EXCHANGER VALVE AND/OR HEAT EXCHANGER BY THE INLET COLLARS. THE INLET COLLARS ARE NOT INTEGRAL PARTS OF THE VALVE HOUSING.

(1) Place the air/oil heat exchanger valve on the bench with the two four hole ducts downward and the three end ports facing the operator.

(2) Place the air/oil heat exchanger on the valve with three hole flange toward the operator.

(3) Secure the heat exchanger to the valve with bolts, threads lubricated with Engine Oil P03-001, washers (under the bolt heads and nuts, omit the four washers at (Post SB PW4ENG 79-44) and (Post SB PW4ENG 79-50) bracket locations) and nuts. Torque the nuts to 36 - 40 lb-in. (4.067 - 4.591 N.m).

(4) (Post SB PW4ENG 79-44) Install a clamp on the wiring harness and secure to the bracket with bolt, threads lubricated with Engine Oil P03-001. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(5) If a new valve was installed, comply with the following:

(a) Install a packing, lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 on the smaller adapter. Lubricate the adapter threads with Engine Oil P03-001 and install it to the smaller port in the valve. Torque the adapter to 65 - 75 lb-in. (7.344 - 8.474 N.m).

(b) Install the packings, lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 on the two larger adapters. Lubricate the adapter threads with Engine Oil P03-001 and install the adapters in the two remaining ports. Torque the adapters to 110 - 120 lb-in. (12.428 - 13.558 N.m).

(c) Install the air shut off valve drain tube (CR09) as follows.

1 (Pre SB PW4ENG 79-49) Lubricate the threads of the smaller adapter with Antiseize Paste P06-054, and attach the tube to the adapter and to the hole in the tube flange on the heat exchanger. Wipe off unwanted paste. Secure the coupling on the tube to the heat exchanger with a jamnut, threads lubricated with Engine Oil P03-001. Torque the jamnut to 70 - 80 lb-in. (7.909 - 9.039 N.m).

2 (Post SB PW4ENG 79-49), (Pre SB PW4ENG 79-50) Lubricate the threads of the smaller adapter with Antiseize Paste P06-054, and attach the tube to the adapter and to the hole in tube flange on the heat exchanger with a plate between flats on the tube and the flange. Wipe

off unwanted paste. Lubricate the threads on the coupling end of the tube with Engine Oil P03-001 and secure it with a washer and a jamnut. Torque the jamnut to 70 - 80 lb-in. (7.909 - 9.039 N.m).

3 (Post SB PW4ENG 79-50) Lubricate the threads of the smaller adapter with Antiseize Paste P06-054, and attach the tube to the adapter and to the exchanger with two bolts, threads lubricated with Engine Oil P03-001. Wipe off unwanted paste. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

4 Torque tube nut to 90 - 100 lb-in. (10.169 - 11.298 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 the tube nut and if equipped bolts or jamnut.

(d) Install the air/oil cooler valve return tube (CR08) and the air/oil cooler valve hydraulic tube (CP08) as follows.

1 (Pre SB PW4ENG 79-49) Lubricate the threads on the remaining adapters with Antiseize Paste P06-054. Wipe off unwanted paste. Attach the tubes to the remaining adapters, with the couplings on the tubes through the tube flange on the heat exchanger. Lubricate the threads on the couplings with Engine Oil P03-001 and secure them with the jamnuts. Torque the jamnuts to 70 - 80 lb-in. (7.909 - 9.039 N.m).

2 (Post SB PW4ENG 79-49), (Pre SB PW4ENG 79-50) Lubricate the threads on the remaining adapters with Antiseize Paste P06-054. Wipe off unwanted paste. Attach the tubes to the remaining adapters, with the couplings on the tubes through the plate and the tube flange on the heat exchanger. Lubricate the threads on the couplings with Engine Oil P03-001 and secure to the tubes with washers and the jamnuts. Torque the jamnuts to 70 - 80 lb-in. (7.909 - 9.039 N.m).

3 (Post SB PW4ENG 79−50) Lubricate the threads on the remaining adapters with Antiseize Paste P06−054. Wipe off unwanted paste. Attach the tubes to the remaining adapters and to the exchanger with bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

4 Torque the tube nuts to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 the tube nuts and if equipped bolts or jamnuts.

(e) Install the clamps, bolt(s), threads lubricated with Engine Oil P03−001, and nut(s) which secure the tubes (CP08) and (CR08). Torque the bolt(s) to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(6) If a new heat exchanger was installed, comply with the following:

(a) Install the upper and lower mount brackets on the heat exchanger. Secure the brackets with bolts, threads lubricated with Engine Oil P03−001. Torque the bolts with PWA 102285 Torque Adapter to 85 − 95 lb−in. (9.604 − 10.734 N.m).

C. Postrequisites

(1) Install Air/Oil Heat Exchanger And Valve (Engine) to engine per Removal/Installation−10 Task 72−00−34−450−006.

Task 72-00-34-450-008:

1. Install HPC Secondary Flow Control Valve, IDGS Air/Oil Heat Exchanger Valve Override Solenoid

A. Equipment And Materials Required

Standard Tools:
Glenair TG-70 Strap Wrench or
Glenair TG-69 Soft Jawed Pliers
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
R P06-054	Paste, Antiseize (PWA 36246)
P11-014	Alcohol, Isopropyl (PMC 9094)

B. Procedure
See Figure 401.

(1) If new solenoid must be installed, do the following:

(a) Remove the protective closures from all openings on the solenoid.

(b) Install two adapters, threads lubricated with Engine Oil P03-001, and two gaskets to two ports on top of solenoid. Torque adapters to 65 - 75 lb-in. (7.344 - 8.747 N.m).

(c) Install cap, threads lubricated with Engine Oil P03-001, to right adapter. Torque cap to 90 - 100 lb-in. (10.169 - 11.298 N.m).

(d) Install two adapters, threads lubricated with Engine Oil P03-001, and two gaskets, larger adapter to center port and smaller adapter to right port, on rear of solenoid. Torque larger adapter to 150 - 170 lb-in. (16.948 - 19.207 N.m). Torque smaller adapter to 110 - 120 lb-in. (12.428 - 13.558 N.m).

(e) Install plug, threads lubricated with Engine Oil P03−001, to left port on rear of solenoid. Torque plug to 110 − 120 lb−in. (12.428 − 13.558 N.m).

(2) FOR THESE MODELS: 4152, 4156A, 4158
Install the solenoid to the intermediate case, at approximately the 1 o'clock position, with two adapters and one plug rearward. Install the switch and bracket assembly to the solenoid and attach with four bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(3) Connect the bleed valve supply tube (AA25) to the solenoid as follows:

(a) Lubricate the threads of the center rear adapter
R with Antiseize Paste P06−054. Wipe off unwanted
R paste.

(b) Install the supply tube nut to the center adapter on the rear of the solenoid.

(c) Torque the tube nut to 225 − 250 lb−in. (25.422 − 28.246 N.m).

(4) Connect the HPC drum air valve signal tube (AA01) to the solenoid as follows:

(a) Lubricate the lower rear adapter on the solenoid with PWA 36246 Antiseize Paste by SPOP 169. (Task 70−41−03−380−049). Refer to section 70−41−03 in the Standard Practices Manual, PN 585005.

(b) Remove excess lubricant.

(c) Install the air solenoid signal tube nut to the adapter.

(d) (Reference 2171) Torque the tube nut to 170 − 180 lb−in. (19.207 − 20.337 N.m).

(e) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the tubes (AA01), (AA25), and plug.

(5) Install pressure switch tube assembly (AA32) as follows.

(a) Lubricate threads at elbow end of tube with Engine Oil P03−001 and threads at straight end of tube
R with Antiseize Paste P06−054. Wipe off unwanted
R paste. Install tube.

(b) Torque elbow end to solenoid adapter to 90 − 100 lb−in. (10.169 − 11.298 N.m). Torque straight end to pressure switch to 65 − 75 lb−in (7.344 − 8.474 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to both ends of the tube and cap.

(6) Connect the W1P10 and the W1P11 harness connectors to the solenoid harness receptacles as follows. For each connector:

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Isopropyl Alcohol P11−014 and let air dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 strap wrench or the Glenair TG−69 soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal). This procedure

will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

C. Postrequisites

(1) Install the fan exit liner segment (inner rear) that is at the 1 o'clock position. Refer to 72−00−33, Installation−16 (Task 72−00−33−440−001).

(Task 72-00-34-450-008)

Task 72-00-34-450-009:

1. Install Start/Stability Bleed Valve Solenoid

A. Equipment And Materials Necessary

Standard Tools:
Glenair TG-70 Strap Wrench Or
Glenair TG-69 Soft Jawed Pliers
Bergen Mechanical Crimper (Optional) Model M303, M305 Or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
R P06-054	Paste, Antiseize (PWA 36246)
P11-009	Alcohol, Denatured Ethyl (AMS 3002)

B. Procedure
See Figure 401.

CAUTION: BE SURE AND USE THE CORRECT PART NUMBER SOLENOID FOR REPLACEMENT. INTERCHANGEABILITY WITH THE W4 WIRING HARNESS CONNECTOR IS EFFECTED. REFER TO SB PW4ENG 73-70 FOR SELECTION.

(1) If new solenoid is being installed comply with the following:

(a) Place valve on bench with two threaded ports up facing operation and solenoids to the right.

(b) Remove protective closures from all openings on solenoid.

(c) Install two adapters, threads lubricated with Engine Oil P03-001, and two gaskets to two ports on top of solenoid. Torque adapters to 65 - 75 lb-in. (7.344 - 8.474 N.m).

(d) Install cap, threads lubricated with Engine Oil P03-001, to adapter furthest from operator. Torque cap to 90 - 100 lb-in. (10.169 - 11.298 N.m).

(e) Install two adapter, threads lubricated with Engine Oil P03−001, larger adapter in center port and smaller adapter to furthest port, and gaskets. Torque larger adapter to 150 − 170 lb−in. (16.948 − 19.207 N.m). Torque smaller adapter to 110 − 120 lb−in. (12.428 − 13.558 N.m).

(f) Install plug, threads lubricated with Engine Oil P03−001, and gasket to remaining rear port. Torque plug to 110 − 120 lb−in. (12.428 − 13.558 N.m).

(2) Install the bleed valve bracket assembly to the intermediate case at approximately the 5 o'clock position. Install four bolts, threads lubricated with Engine Oil P03−001, through the bracket and into the intermediate case. Tighten and torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(3) Position solenoid to bracket on intermediate case at approximately 5 o'clock position, with electrical connectors facing rearward. Secure with four bolts, threads lubricated with Engine Oil P03−001, and bracket (Post SB PW4ENG 75−41 only). Torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

NOTE: For (Post SB PW4ENG 75−41) engines, align the bracket boltholes per Figure 401 (Sheet 1). Loosen and torque the bolts again if necessary.

(4) Lubricate threads of solenoid rear center adapter with
R Antiseize Paste P06−054. Wipe off unwanted paste. Install (AA27) bleed valve supply tube assembly to adapter. Torque tube nut to 225 − 250 lb−in. (25.422 − 28.246 N.m).

(5) Lubricate threads of remaining solenoid rear adapter
R with Antiseize Paste P06−054. Wipe off unwanted paste. Install (AA26) bleed valve signal tube assembly to adapter. Torque tube nut to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the two rear tubes and plug.

(6) Install the (AA35), (AA36), and (AA37) bleed valve supply tubes as follows.

(a) Lubricate the elbow threads of the (AA35) tube with Engine Oil P03−001. Lubricate the remaining (AA35), (AA36), and (AA37) tube nut threads with Antiseize Paste P06−054. Wipe off unwanted paste. R

(b) Install the (AA35), (AA36), and (AA37) tubes per figure and tighten by hand.

(c) Install the clamp arrangements per figure with the bolts lubricated with Engine Oil P03−001. Torque the clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(d) Torque the elbow end of the (AA35) tube to 90 − 100 lb−in. (10.169 − 11.298 N.m). Torque the opposite end of the (AA35) tube to 65 − 75 lb−in. (7.344 − 8.474 N.m).

(e) Torque the (AA36) tube at both ends to 200 − 225 lb−in. (22.597 − 25.422 N.m).

(f) Torque the (AA37) tube to the relay valve to 225 − 250 lb−in. (25.422 − 28.246 N.m). Torque the opposite end of the (AA37) tube to 200 − 225 lb−in. (22.597 − 25.422 N.m).

(g) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to all the tubes.

(7) Connect the W4P4 and the W5P11 harness connectors to the solenoid harness receptacles as follows. For each connector:

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG-70 strap wrench or the Glenair TG-69 soft-jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

C. Postrequisites

(1) Install the fan exit liner segment (inner rear) that is at 5 o'clock. Refer to 72-00-33, Installation-16 (Task 72-00-33-440-001).

Start/Stability Bleed Valve Solenoid (Post SB PW4ENG 75-41)
Figure 401 (Sheet 4)
(Task 72-00-34-450-009)

Task 72-00-34-450-010:

1. Install HPC Secondary Flow Control Valve, Turbine Vane And Blade Cooling Air Valve Solenoid

A. Equipment And Materials Required

Standard Tools:
Glenair TG-70 Strap Wrench or
Glenair TG-69 Soft Jawed Pliers
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
	P05-292	Ferrule, Safety Cable (Optional)
R	P06-054	Paste, Antiseize (PWA 36246)
	P11-014	Alcohol, Isopropyl (PMC 9094)

B. Procedure
See Figure 401.

(1) If a new solenoid must be installed, do the following:

(a) Remove the protective closures from all openings on the solenoid.

(b) Install two adapters, threads lubricated with Engine Oil P03-001, and gaskets to two ports on top of solenoid. Torque adapter to 65 - 75 lb-in. (7.344 - 8.474 N.m).

(c) Install two caps, threads lubricated with Engine Oil P03-001, to above adapters. Torque the caps to 90 - 100 lb-in. (10.169 - 11.298 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to the caps.

(d) Install three adapters, threads lubricated with Engine Oil P03-001, and gaskets, larger adapter in center, to rear ports of solenoid. Torque center larger adapter to 150 - 170 lb-in. (16.948 - 19.207 N.m). Torque two remaining adapters to 110 - 120 lb-in. (12.428 - 13.558 N.m).

(2) Install the solenoid to the intermediate case and under the bracket leg, at approximately the 10 o'clock position, with the three adapters rearward. Attach with four bolts, threads lubricated with Engine Oil P03−001, and torque to 85 − 95 lb−in. (9.604 − 10.734 N.m). If the clamp bolt on the bracket was loosened for removal of the solenoid, tighten and torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

R (3) Lubricate center rear adapter threads with Antiseize
R Paste P06−054 and install supply tube assembly. Wipe
R off unwanted paste. Torque tube nut to 225 − 250 lb−in. (25.422 − 28.246 N.m).

(4) Lubricate remaining two rear adapter threads with Engine Oil P03−001 and install signal tube assemblies. Torque tube nuts to 270 − 300 lb−in. (30.506 − 33.895 N.m).

(5) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to all the tubes.

(6) FOR THESE MODELS: 4152, 4156A, 4158
Connect the W3P12 harness connector to the solenoid harness receptacle as follows.

(a) FOR THESE MODELS: 4152, 4156A, 4158
Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Isopropyl Alcohol P11−014 and let air dry.

(b) FOR THESE MODELS: 4152, 4156A, 4158
Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: FOR THESE MODELS: 4152, 4156A, 4158
The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: FOR THESE MODELS: 4152, 4156A, 4158
USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) FOR THESE MODELS: 4152, 4156A, 4158
Use the Glenair TG-70 strap wrench or the Glenair TG-69 soft-jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal). This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: FOR THESE MODELS: 4152, 4156A, 4158
If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: FOR THESE MODELS: 4152, 4156A, 4158
See the instructions given with the strap wrench for correct use.

C. Postrequisites

(1) Install the fan exit liner segment (inner rear) that is at the 10 o'clock position. Refer to 72-00-33, Installation-16 Task 72-00-33-440-001.

ENGINE GENERAL - INTERMEDIATE CASE - INSTALLATION-15

Task 72-00-34-450-011:

1. Install IDGS Air/Oil Heat Exchanger Valve Override Pressure Switch

A. Equipment And Materials Required

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
R P06-054	Paste, Antiseize (PWA 36246)

B. Procedure
See Figure 401 or Figure 402.

(1) Remove the protective closures.

(2) Install the override pressure switch to the bracket, at approximately the 1 o'clock position on the intermediate case, with the electrical connector rearward. Attach the override pressure switch to the bracket with two bolts, threads lubricated with Engine Oil P03-001. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

R (3) Lubricate the adapter threads with Antiseize Paste
R P06-054 and install the tube nut. Remove unwanted
R paste. Torque the tube nut to 65 - 75 lb-in. (7.344 - 8.474 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to the tube nut.

C. Postrequisite

(1) Install the fan exit liner segment (inner rear) that is at approximately the 1 o,clock position. Refer to 72-00-33, Installation-16 Task 72-00-33-440-001.

Task 72-00-34-450-012:

1. Install The Stability Bleed Pneumatic Relay Valve

A. Equipment And Materials Required

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
R	P06-054	Paste, Antiseize (PWA 36246)

B. Procedure

See Figure 401.

(1) If a new replacement relay valve is being installed, do as follows.

(a) Remove the protection covers from the valve.

(b) Install the three adapters, lubricated with Engine Oil P03-001, and gaskets to the ports on the valve.

(c) Torque the largest adapter to 150 - 170 lb-in. (16.948) - 19.207 N.m). Torque the middle adapter to 110 - 120 lb-in. (12.428 - 13.558 N.m). Torque the smallest adapter to 65 - 75 lb-in. (7.344 - 8.474 N.m).

(2) Position the relay valve to the bracket. Attach the valve with three bolts, lubricated with Engine Oil P03-001, and nuts. Torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(3) For engines without the bleed valve supply tube maintenance break (Pre SB PW4ENG 75-28), install the bleed valve supply tube to the largest adapter,
R lubricated with Antiseize Paste P06-054. Wipe off
R unwanted paste. Torque the tube nut to 225 - 250 lb-in. (25.422 - 28.246 N.m).

NOTE: Install the lockwire when you install the start/stability bleed valve solenoid.

C. Postrequisites

(1) Install the start/stability bleed valve solenoid. See Installation-13 Task 72-00-34-450-009.

ENGINE GENERAL - INTERMEDIATE CASE - INSTALLATION-17

Task 72-00-34-450-013:

1. Install EEC Speed Transducer (N1) Multiplexer Input Probe

A. Equipment And Materials Required

Standard Tools:
Glenair TG-70 Strap Wrench or
Glenair TG-69 Soft Jawed Pliers
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P05-395	Beeswax
P05-396	Paraffin Wax Blend
P06-002	Petrolatum White (PMC 9609)
P11-009	Alcohol, Denatured Ethyl (AMS 3002)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Key Washer	4	73-23-00/1/30
Packing	2	73-23-00/1/1
Packing	1	73-23-00/1/10

B. Procedure
See Figure 401.

(1) Remove protective closures.

(2) Examine and adjust, if necessary, the gap between the end of the transducer and the rotor as follows.

(a) Apply Beeswax P05-395 or Paraffin Wax Blend P05-396, approximately 0.070 inch (1.778 mm) thick, to the flat surface on the small end of the transducer probe.

(b) Install a Class 1 shim on the lower shoulder of the transducer end.

NOTE: Do not install the three packings on the transducer at this time.

CAUTION: INSTALL THE TRANSDUCER WITH THE LARGER ELECTRICAL CONNECTOR REARWARD. DO NOT TURN THE TRANSDUCER DURING INSTALLATION OR DAMAGE TO THE TRANSDUCER OR ENGINE CAN RESULT.

(c) Temporarily install the spring−loaded speed transducer probe into the opening in the intermediate case at approximately 5 o'clock position with the larger electrical connector rearward.

(d) Lubricate the bolts and nut (if equipped with the locating stud, Post SB PW4ENG 73−88) with Engine Oil P03−001. Temporarily install the washers, bolts, and nut (if equipped). Tighten evenly and engage the transducer to the case completely. Torque the bolts and nut (if equipped) to 85 lb−in. (9.604 N.m). Be sure you engage the transducer to the case completely.

(e) Slowly turn the fan rotor approximately 15 degrees counterclockwise as viewed from the front of the engine.

(f) Loosen the bolts and nut (if equipped) and remove the transducer probe from the engine.

(g) (Reference 775) Carefully cut a section of wax away from the end of the transducer and measure the thickness of wax remaining in the area of deepest impression. If the result is between 0.020 − 0.050 inch (0.508 − 1.270 mm), the proper shim is installed.

(h) If the result is smaller than 0.020 inch (0.508 mm), replace the Class 1 shim with a Class 2 shim.

(i) If the result is greater than 0.050 inch (1.270 mm), remove the Class 1 shim.

(j) Remove all wax from the end of the transducer probe.

ENGINE GENERAL − INTERMEDIATE CASE − INSTALLATION−17

(3) Install two new packings, lubricated with Engine Oil P03−001, to the grooves in the shaft of the transducer. Install one new packing, lubricated with White Petrolatum P06−002, to the groove in the transducer flange. Be sure the correct shim (if required) is installed on the transducer.

CAUTION: INSTALL THE TRANSDUCER WITH THE LARGER ELECTRICAL CONNECTOR REARWARD. DO NOT TURN THE TRANSDUCER DURING INSTALLATION OR DAMAGE TO THE TRANSDUCER OR ENGINE CAN RESULT.

(4) Carefully reinstall the transducer probe in the intermediate case with the larger electrical connector rearward.

(5) For engines with the No. 1 bearing vibration transducer cable bracket, install the bracket to the forward two holes. Attach the transducer as follows. See Figure 401, (Sheet 2).

CAUTION: YOU MUST USE KEY WASHERS WITH CASES THAT DO NOT HAVE SELF−LOCKING INSERTS IN THE INTERMEDIATE BOSS.

(a) Lubricate the bolts with Engine Oil P03−001.

(b) Install the bolts and washers (key washers for engines without self−locking inserts) that attach the transducer. Tighten evenly by hand.

NOTE: Use the longer bolts at the bracket location if equipped.

NOTE: (Post SB PW4ENG 72−182) Install the drilled bolt into the mounting hole next to the PT2.5 connection on the transducer.

(c) For engines with the locating stud, install the key washer and nut, lubricated with Engine Oil P03−001. Tighten by hand.

(d) Torque (as equipped)
- the bolts without the self−locking insert feature to 65 − 85 lb−in. (7.344 − 9.604 N.m).
- the bolts with the self−locking insert feature to 85 − 95 lb−in. (9.604 − 10.734 N.m).
- the nut on the locating stud to 150 − 170 lb−in. (16.948 − 19.207 N.m).

(e) Bend the key washer tabs if used.

(6) If equipped, install the clamp and bolt, lubricated with Engine Oil P03−001, and attach the No. 1 bearing vibration transducer cable to the bracket. Torque the clamp bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

CAUTION: DO NOT USE LUBRICANTS ON PMUX SENSING TUBES, ADAPTERS, OR PACKINGS. CONTAMINATION OF PMUX CAN RESULT.

(7) Connect the PT2.5 tube (AS31) to the transducer handtight only.

(8) Install the clamp and bolt, lubricated with Engine Oil P03−001, that attach the tube to the Flange E bracket at approximately 5 o'clock position. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(9) Torque the tube nut to 135 − 150 lb−in. (15.253 − 16.948 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

NOTE: (Post SB PW4G 72−182) Safety the transducer tube nut to the drilled transducer mount bolt.

(10) Connect the W4P19 and the W4P23 harness connectors to the transducer harness receptacles as follows. For each connector:

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

ENGINE GENERAL − INTERMEDIATE CASE − INSTALLATION−17

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 Strap Wrench or the Glenair TG−69 Soft−Jawed Pliers and tighten the connector coupling nut. Use sufficient force to be sure:

- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal). This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

C. Postrequisites

(1) Install the fan exit liner segment (inner rear) that is at 5 o'clock. Refer to 72−00−33, Installation−16 Task 72−00−33−440−001.

ENGINE GENERAL - INTERMEDIATE CASE - INSTALLATION-18

Task 72-00-34-450-017:

1. Install EEC Wiring Harness - W3 (Core Engine)

A. General

(1) To install the EEC wiring harness - W4, see 72-00-34, Installation-19 (Task 72-00-34-450-018).

(2) To install the EEC wiring harness - W5, see 72-00-34, Installation-20 (Task 72-00-34-450-019).

B. Equipment And Materials Necessary

Standard Tools:
Glenair TG-70 Strap Wrench or
Glenair TG-69 Soft Jawed Pliers

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P11-009	Alcohol, Denatured Ethyl (AMS 3002)

Expendable Parts:

Part Name	Quantity	Parts Catalog Reference Section/Figure/Item
Tape - Lacing And Tying, PN 1B1773		

C. Procedure
See Figure 401, Figure 402, Figure 403, Figure 404, Figure 405, Figure 406, Figure 407, Figure 408 and Figure 409.

CAUTION: SEE 72-00-00, INSTALLATION-00 FOR THE GENERAL INSTALLATION REQUIREMENTS FOR THE ELECTRICAL HARNESSES, LEADS AND CABLES.

CAUTION: DO NOT TWIST OR BEND THE HARNESS BADLY DURING THE INSTALLATION, OR DAMAGE TO THE HARNESS CAN OCCUR.

(1) Install the W3 harness on the left side of the engine as follows.

(a) Remove the protective closure. Install the W3J24 connector flange to the HPC case bracket located at the 10 o'clock position. Install the harness bracket that attaches the connector flange to the bracket. Align the bolt holes and install the bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Figure 403.

(2) Connect the W3 harness connectors (given below) to the mating harness receptacles as follows. See Figure 402. For each connector:

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 Strap Wrench or the Glenair TG−69 Soft−Jawed Pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).

This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

Connector	Component	Location
W1P24	Harness Connector To W3J24 Harness Connector	10:00 O'Clock
W3P12	HPC Secondary Flow Control Valve, Turbine Cooling Air Valve Solenoid	Intermediate Case 10:00 O'Clock
W3P17	Air/Oil Heat Exchanger And Valve (Engine)	8:00 O'Clock
W3P15	2.5 Bleed Valve Actuator	Intermediate Case 7:30 O'Clock
W3P5	Fuel/Oil Cooler Bypass Valve Solenoid (Forward Connector)	8:00 O'Clock
W3P1	EEC Alternator (Upper Connector)	Bottom Of Gearbox 7 O'Clock
W3P18	EEC Oil Temperature Thermocouple Probe	Front Of Gearbox 7 O'Clock

(3) (Pre SB PW4ENG 73−84), Connect the W3P18 connector of the harness to the EEC oil temperature thermocouple probe as follows.

(4) (Post SB PW4ENG 73−84), For a thermocouple probe with a studded terminal type receptacle and for engines equipped with 2.95 bleed valve thermocouple install the wiring harness as follows.

(a) Install the wiring harness terminals to the thermocouple studs and install loosely the nuts to the thermocouple studs.

(b) Install the clamp, ground strap, and bolt loosely to the bracket on the housing.

CAUTION: TO PREVENT DAMAGE TO THE WIRING HARNESS, MAKE SURE THE THERMOCOUPLE STUD BOX DOES NOT TURN WHEN THE COUPLING NUT IS TORQUED.

(c) If necessary to align the thermocouple stud box, remove the lockwire from the thermocouple coupling nut to the adapter and loosen the coupling nut.

(d) Align the thermocouple stud box with the wiring harness connector.

(e) (Reference 2167) Hold the thermocouple stud box and torque the thermocouple probe coupling nut to 95 − 100 lb−in. (10.734 − 11.298 N.m). Do not let the thermocouple studs turn.

CAUTION: DO NOT ALIGN THE THERMOCOUPLE STUD BOX AFTER THE COUPLING NUT IS TORQUED. HOLD THE THERMOCOUPLE STUD BOX AND LOOSEN THE COUPLING NUT AND ALIGN THE THERMOCOUPLE STUD BOX AGAIN.

(f) Make sure the thermocouple stud box is aligned. Do not put too much force on the terminals of the wiring harness.

CAUTION: TOO MUCH TORQUE (MORE THAN MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(g) (Reference 2273) Torque the alumel nuts (larger terminal studs) to 18 − 22 lb−in. (2.034 − 2.486 N.m).

(h) (Reference 2273) Torque the chromel nuts (smaller terminal studs) to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(i) Install lockwire from the coupling nut to the adapter.

(j) Torque the bolt that attachs the clamp and ground strap to the bracket on the housing to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(5) Adjust the W3 harness for any necessary clearances as required. Install the clamps at all clamp points. Refer to the figures. Attach the clamps loosely to the engine with bolts and/or nuts, threads lubricated with Engine Oil P03−001.

NOTE: Use different clamp sizes on the harnesses to prevent harness movement when tightened. See the Illustrated Parts Catalog for selection of the clamp sizes and part numbers.

(6) Make sure that the harnesses are not tight to the point where sharp bends are caused, and that the harnesses do not touch any engine parts or plumbing. Provide a drip loop on the leads where the wires run downward into the connector.

(7) Tighten all the previously installed clamp nuts and/or bolts to a torque of 36 − 40 lb−in. (4.067 − 4.519 N.m).

(8) Tie the harnesses as shown in Figure 409.

NOTE: Ties must be made with a clove hitch with an extra loop, followed by a square knot, as shown in Figure 409. The clove hitch and square knot must be tightened satisfactorily in place. The harnesses must not be stressed or damaged by overtightening the ties. Where the harness bundles are more than 1.500 inches (38.100 mm) in diameter, the lacing tape must be doubled. Cut the ends of the lacing tape to a length of 0.250 − 0.500 inch (6.350 − 12.700 mm).

Task 72−00−34−450−018:

1. Install EEC Wiring Harness − W4 (Core Engine)

A. General

(1) To install the EEC wiring harness − W3, see 72−00−34, Installation−18 Task 72−00−34−450−017.

(2) To install the EEC wiring harness − W5, see 72−00−34, Installation−20 Task 72−00−34−450−019.

B. Equipment And Materials Required

Standard Tools:
Glenair TG−70 Strap Wrench or
Glenair TG−69 Soft Jawed Pliers

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)
P11−009	Alcohol, Denatured Ethyl (AMS 3002)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Tape − Lacing And Tying, PN 1B1773		
Lockwire, AS3214−01		

C. Procedure
See Figure 401, Figure 402, Figure 403, Figure 404, Figure 405, Figure 406, Figure 407, Figure 408, Figure 409, Figure 410 and Figure 411.

NOTE: Items referred to as numbers in parenthesis in text are identified in Figure 401.

CAUTION: SEE 72−00−00, INSTALLATION−00 FOR THE GENERAL INSTALLATION REQUIREMENTS FOR THE ELECTRICAL HARNESSES, LEADS AND CABLES.

CAUTION: DO NOT TWIST OR BEND THE HARNESS BADLY DURING THE INSTALLATION, OR DAMAGE TO THE HARNESS CAN OCCUR.

CAUTION: BE SURE AND USE THE CORRECT PART NUMBER W4 WIRING HARNESS FOR REPLACEMENT. INTERCHANGEABILITY WITH THE START/STABILITY

BLEED VALVE SOLENOID (5 O'CLOCK POSITION) IS EFFECTED. REFER TO SB PW4ENG 73−70 FOR SELECTION.

(1) If the top and lower harness support brackets (401/1, 401/5) have been previously removed from the right side of the HPC case, install the brackets as follows:

(a) Install the top harness support bracket (401/1) to the turbine cooling valve actuator bracket (401/2) and to the bracket (401/3) on the compressor stator cylinder support. Attach the support bracket (401/1) with bolts, threads lubricated with Engine Oil P03−001, washers (next to the boltheads) and nuts. Torque the bolts and nut to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(b) Install the lower harness support bracket (401/5) to the outer face of the cross brace on the compressor stator cylinder support (401/4). Attach the support bracket (401/5) with bolts, threads lubricated with Engine Oil P03−001, (boltheads inboard), washers (next to nuts) and nuts. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) Attach bracket (401/6) to the inner face of the lower harness support bracket (401/5) with bolts, threads lubricated with Engine Oil P03−001, (boltheads outboard), washer (next to boltheads) and nuts handtight.

(d) Put a feeler gage between the end of the bracket (401/6) and the compressor stator cylinder support (401/7) so that the brackets are parallel with each other, and the bolts installed in step (c), are aligned in the bolt holes. Have a second person torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m) while holding the brackets in position along with the feeler gage.

(e) Remove the feeler gage and find the thickness used. Record the thickness. Use a minimum amount of shims. Use shims 0 − 4 (0.038 − 0.048 inch) (0.965 − 1.219 mm) and/or shims 0 − 8 (0.022 − 0.028 inch) (0.559 − 0.711 mm), as required, that will be equal to, or up to 0.010 inch (0.254 mm) less than the thickness recorded.

(f) Install the shims between the brackets. Align the bolt holes and attach the brackets together with bolts, threads lubricated with Engine Oil P03-001, (boltheads up) and nuts. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m). Make sure a maximum gap of 0.010 inch (0.254 mm) is between the shims and the brackets after the bolts are torqued.

(2) Install the W4 harness on the right side of the engine.

(a) Remove the protective closure. Install the W4J25 connector flange to the HPC case bracket located at the 1 o'clock position. Install the harness bracket (cut-out rearward) to attach the connector flange between the two brackets. Align the bolt holes and install the bolts, threads lubricated with Engine Oil P03-001. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m). See Figure 404.

(3) FOR THESE MODELS: 4152, 4156A, 4158
(Pre SB PW4ENG 72-572 or Pre SB PW4ENG 75-106 or SB PW4ENG 72-756) Connect the W4P10 harness connector to the HPC secondary flow control valve located at the 3:30 o'clock position as follows. See Figure 403.

(a) FOR THESE MODELS: 4152, 4156A, 4158
Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11-009. Let dry.

CAUTION: FOR THESE MODELS: 4152, 4156A, 4158
USE THE CORRECT ASSEMBLY TORQUE. USE OF THE WRONG TORQUE CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTENING PROTECTION.

(b) FOR THESE MODELS: 4152, 4156A, 4158
(Reference 2154) Tighten and torque the connector to 21 - 26 lb-in. (2.373 - 2.938 N.m). Lockwire the connector nut with AS3214-01 Lockwire.

NOTE: FOR THESE MODELS: 4152, 4156A, 4158
SB PW4ENG 72-572 or SB PW4ENG 75-106 or

SB PW4ENG 72-756 removes connector W4P10 from the W4 wiring harness. See Figure 403 (Sheet 2).

(4) FOR THESE MODELS: 4152, 4156A, 4158
(SB PW4ENG 72-572 or Pre SB PW4ENG 75-106 or SB PW4ENG 72-756) Connect the W4P21 harness connector to the turbine vane and blade cooling air valve located at the 3 o'clock position as follows. See Figure 403.

(a) FOR THESE MODELS: 4152, 4156A, 4158
Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11-009. Let dry.

CAUTION: FOR THESE MODELS: 4152, 4156A, 4158
USE THE CORRECT ASSEMBLY TORQUE. USE OF THE WRONG TORQUE CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTENING PROTECTION.

(b) FOR THESE MODELS: 4152, 4156A, 4158
(Reference 2156) Tighten and torque the connector to 30 - 35 lb-in. (3.390 - 3.954 N.m). Lockwire the connector nut with AS3214-01 Lockwire.

NOTE: FOR THESE MODELS: 4152, 4156A, 4158
SB PW4ENG 72-572 or SB PW4ENG 75-106 or SB PW4ENG 72-756 removes connector W4P21 from the W4 wiring harness. See Figure 403 (Sheet 2).

(5) Connect the W4 harness connectors (given below) to the mating harness receptacles as follows. See Figure 403. For each connector:

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11-009. Let dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 strap wrench or the Glenair TG−69 soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).

This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

Connector	Component	Location
W4P16	Turbine Case Cooling (TCC) Air Valve Actuator	2 O'Clock
W4P2	Fuel Metering Unit (Forward Connector)	Front Of Fuel Pump 5 O'Clock
W4P3	Variable Stator Vane Actuator (Lower Connector)	4 O'Clock
W4P4	Ninth Stage	Intermediate Case 5

Connector	Component	Location
(CONTINUED)		
	Start/Stability (2.9) Bleed Valve Solenoid (Outboard Connector)	O'Clock
W4P19	EEC Speed Transducer (N1)	Intermediate Case 4:30 O'Clock
W4P23	EEC Speed Transducer (N1) (Engines Incorporating PMUX or SCU)	Intermediate Case 4:30 O'Clock
W1P25	Harness Connector To W4J25 Harness Connector	1 O'Clock

(6) Adjust the W4 harness for any necessary clearances as required. Install the clamps at all clamp points. Refer to the figures. Attach the clamps loosely to the engine with bolts, spacers and/or nuts, threads lubricated with Engine Oil P03−001.

NOTE: Use different clamp sizes on the harnesses to prevent harness movement when tightened. See the Illustrated Parts Catalog for selection of the clamp sizes and part numbers.

(7) Make sure that the harnesses are not tight to the point where sharp bends are caused, and that the harnesses do not touch any engine parts or plumbing. Provide a drip loop on the leads where the wires run downward into the connector.

(8) Tighten all the previously installed clamp nuts and/or bolts to a torque of 36 − 40 lb−in. (4.067 − 4.519 N.m).

(9) Tie the harnesses as shown in Figure 411.

NOTE: Ties must be made with a clove hitch with an extra loop, followed by a square knot, as shown in Figure 411. The clove hitch and square knot must be tightened satisfactorily in place. The harnesses must not be stressed or damaged by overtightening the ties. Where the harness bundles are more than 1.500 inches (38.100 mm) in diameter, the lacing tape must be doubled. Cut the ends of the lacing tape to a length of 0.250 − 0.500 inch (6.350 − 12.700 mm).

ENGINE GENERAL − INTERMEDIATE CASE − INSTALLATION−20

Task 72−00−34−420−020:

1. Install The Flange E Brackets And Hardware

A. Equipment And Materials Necessary

Consumable Materials:

Item No.	Designation
P06−021	Compound, Antigalling (PWA 550)

B. Procedure

(1) Install Flange E hardware as follows. See Figure 401.

(a) Apply Antigalling Compound P06−021 to the threads of 74 Flange E bolts.

(b) Replace the workbolts and install the brackets and 74 bolts in Flange E.

(c) Remove the alignment pins from Flange E.

(2) Remove any tags or markings on the brackets or flange.

(3) Examine the assembly for foreign objects, damage, and correct assembly.

Task 72-00-34-420-004:

1. Install The Fan Unit On The Core Engine

A. Prerequisites

(1) If disassembled, install the HPC top front case. See 72-00-35, Installation-18 (Task 72-00-35-430-001).

(2) If applicable, trunnion the fan unit from rear end down to horizontal position. Refer to 72-00-00, Special Procedures-22 (Task 72-00-00-420-004).

B. Equipment And Materials Necessary

Standard Tools:
Glenair TG-70 Strap Wrench or
Glenair TG-69 Soft Jawed Pliers
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 25757	Pedestal (2 Necessary)
PWA 25926	Adapters (2 Necessary)
PWA 29855-7	Pins, Aligning (2 Necessary)
PWA 76154	Adapter (2 Necessary)
PWA 76155	Sling
PWA 85260	Pins, Aligning (2 Necessary)
PWA 85429	Wrench
PWA 85471	Wrench, Torque
PWA 85537	Fixture, Handling
PWA 85585	Ring, Guide
PWA 85623	Eye, Lifting
PWA 85631	Guide, Piloting
PWA 85768	Puller
PWA 85785	Adapter, Piloting
PWA 86209	Retainer, Positioning (Optional To PWA 85537)
PWA 86598	Retainer, Positioning (Optional To PWA 86209)
PWA 88204	Guide, Piloting

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
	P05-292	Ferrule, Safety Cable (Optional)
R	P06-021	Compound, Antigalling (PWA 550-3)
R	P06-053	Lubricant, Sealing Ring (PWA 36500)
R	P06-054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM

Lockwire, MS9226-06		

C. Procedure - Install The Fan Unit To The Core Engine

(1) If installed, remove the turbine shaft nut and washer from the front of the LPT shaft. Use PWA 85429 Wrench. See Figure 401.

(2) If not installed, install PWA 85585 Guide Ring on the No. 1.5-bearing-support-assembly with detail screws. See Figure 402.

(3) If not installed, install PWA 85785 Adapter to the front of the fan hub as follows.

(a) Move the legs of the adapter to their outermost position.

(b) Engage the rear of the fan hub.

(c) Tighten the wing nuts to hold the legs in position.

(4) If not installed, install the PWA 88204 Guide in the front of the LPT shaft on the core-unit. Tighten by hand. See Figure 403.

CAUTION: DO NOT SUPPORT THE FRONT OF THE CORE-UNIT BY THE PWA 85631 GUIDE YOU INSTALL ON THE FRONT OF THE UNIT. DO NOT PUT ANY FORCE OR STRESS ON THE GUIDE. TOO MUCH STRESS ON THE GUIDE CAN CAUSE DAMAGE TO THE PLAIN ROUND NUT.

(5) If not installed, install PWA 85631 Guide as follows.

(a) Install the guide in the plain round nut. Be sure the threads engage correctly.

(b) Use PWA 85471 Wrench and tighten the guide until seated.

NOTE: If equipped, the four grooves on the PWA 85631 Guide Change B, must be fully rearward of the PWA 85585 Guide Ring front surface. If the grooves are not fully rearward of the ring, the threads of the guide are not fully engaged.

(6) If not installed, attach PWA 85623 Eye to the intermediate case at 12 o'clock with the detail screws. See Figure 404.

(7) Support the engine with hoists at:

(a) The front of the fan unit. Use, in addition to a hoist and PWA 86567 Adapters, PWA 76155 Sling and two PWA 76154 Adapters.

(b) The rear of the fan unit: PWA 85659 Eye.

NOTE: There is already a Hoist and PWA 85390 Adapters that support the center of the core-unit.

(8) If installed, remove PWA 85537 Fixture or PWA 86598 Retainer or PWA 86209 Retainer. See Figure 405.

(9) If installed, remove the pedestals from the fan unit.

ENGINE GENERAL − INTERMEDIATE CASE − INSTALLATION−21

(10) For engines that have incorporated SB PW4ENG 72−48, install a packing on the rear of the intermediate case as follows. See Figure 406.

R (a) Lubricate a packing with Engine Oil P03−001 or
R Sealing Ring Lubricant P06−053.

(b) Install the packing.

R (11) Lubricate a packing with Engine Oil P03−001 or Sealing
R Ring Lubricant P06−053 and install it on the No. 2
R bearing support assembly.

R (12) Install the transfer tube and the new packings,
R lubricated with Engine Oil P03−001 or Sealing Ring
R Lubricant P06−053 to the No. 2 bearing support.

(13) Install PWA 85260 Aligning Pins in the intermediate case. See Figure 406.

(a) Install them at 3 and 9 o'clock positions.

(b) Install them in the Flange E boltholes.

(14) Install PWA 29855−7 Aligning Pins in the intermediate case. See Figure 406.

(a) Install them at 6 and 12 o'clock positions.

(b) Install them in the Flange E boltholes.

(15) Install the gearbox−driveshaft−(front)−housing (called front housing) and the gearbox driveshaft in the gearbox driveshaft housing (called rear housing) as follows. See Figure 407.

(a) Lubricate with Engine Oil P03−001 two packings. Install the packings on the front and rear of the front housing.

(b) Install the front housing in the rear housing. Push the front housing to the rear.

(c) Install the gearbox driveshaft in the rear housing as follows.

1 Make sure that the retaining ring is on the gearbox driveshaft.

2 Mate the gearbox driveshaft splines with the splines of the gearshaft in the main gearbox.

3 Carefully push the gearbox driveshaft to the rear.

(16) Remove the protective caps, plugs, and covers from the openings on the rear of the fan−unit at:

(a) The EEC PB sensing tube nut at 12:30 o'clock position.

(b) The tube adapters of the three solenoids at 1, 5, and 10 o'clock positions.

(c) The No. 3−bearing−air−cooler−adapters at 2:30 o'clock position.

(d) The bleed−valve−supply tube nut and tube coupling at 5 o'clock position.

(e) The angle−gearbox−oil−pressure adapter on the angle gearbox at 6 o'clock position.

(f) The cooling−air−tube adapter at 6:30 o'clock position.

(g) The 1, 1.5, and 2 main−bearing−oil−scavenge−tube coupling at 7:30 o'clock position.

(h) The main−bearing−oil−breather−tube nut at 11:30 o'clock position.

(i) The EEC PT4.95 sensing tube nut at 11:30 o'clock position.

(17) Remove the protective caps, plugs, and covers from the openings on the front of the core−unit at:

(a) The EEC PB sensing tube coupling at 12:30 o'clock position.

(b) The tube nuts that attach to the three solenoids at l, 5, and 10 o'clock positions.

(c) The two No. 3−bearing−air−cooler−tube nuts at 2:30 o'clock position.

(d) The bleed-valve-supply-tube nut and adapter at 5 o'clock position.

(e) The angle-gearbox-pressure-tube nut at 6 o'clock position.

(f) The No. 1, 1.5, and 2 bearing-oil-scavenge-tube nut at 7:30 o'clock position.

(g) The main-bearing-oil-breather-tube coupling at 11:30 o'clock position.

(h) The EEC 4.95 sensing tube coupling at 11:30 o'clock position.

(18) Put the fan unit and the core engine together as follows. See Figure 408.

CAUTION: BE SURE TO ALIGN THE CORE-UNIT AND FAN-UNIT ACCURATELY. DO NOT PERMIT THE PWA 85631 GUIDE ON THE FRONT OF THE CORE-UNIT TO TOUCH THE NO. 2 BEARING CARBON SEAL. DAMAGE TO THE SEAL CAN RESULT.

CAUTION: DO NOT SUPPORT THE FRONT OF THE CORE-UNIT BY THE PWA 85631 GUIDE THAT IS INSTALLED ON THE FRONT OF THE CORE-UNIT. DO NOT PUT ANY FORCE OR STRESS ON THE GUIDE. TOO MUCH STRESS ON THE GUIDE CAN CAUSE DAMAGE TO THE PLAIN ROUND NUT.

(a) Be sure the dowel pin on the front of the No. 2 bearing support is aligned with the dowel pin hole in the No. 1.5 bearing support flange.

(b) Be sure the oil transfer tube will engage the hole in the tube connector in the No. 1.5 bearing support assembly.

(c) Be sure the bevel gear on the LPT shaft is aligned with the bevel gear in the intermediate case. See Figure 407. If not, turn the gear in the HPC as follows.

1 Remove two bolts and washers that attach the manual crank cover to the scavenge pump drive bearing housing assembly. See Figure 409.

2 Remove the cover (manual crank) with PWA 85768 Puller. See Figure 409.

3 To align the bevel gears, turn the gearshaft in the main gearbox with a wrench through the crank pad. See Figure 409.

(d) Carefully align and install the fan−unit to the core−unit until Flange E is almost together. Be sure the distance between the fan−unit and the core−unit at Flange E is approximately the same all around. At the same time, be very careful to correctly engage the bevel gears, oil transfer tube, and dowel pin.

(e) Engage the diameters of the intermediate case and the HPC.

(f) Lubricate with Engine Oil P03−001 33 bolts (No. 1.5 bearing support assembly).

(g) Remove the four workbolts that are in the 33 bolt circle of the No. 1.5 bearing support assembly. Install 33 bolts in the boltholes.

(h) Lubricate with Antigalling Compound P06−021 74 bolts (HPC Flange E).

(i) Install the 74 bolts and, where applicable, brackets in the HPC Flange E.

1 Remove the four aligning pins.

2 For engines with the 2.5 bleed actuator support bracket (Post SB PW4ENG 75−84), attach the support bracket to a bracket on Flange E with three nuts and bolts, threads lubricated with Engine Oil P03−001. Torque the nuts 85 − 95 lb−in. (9.604 − 10.734 N.m).

(j) At the same time, tighten the bolts in the 33 bolt circle and 74 bolt circle.

(k) Torque:

1 Seventy−four bolts to 225 − 250 lb−in. (25.422 − 28.246 N.m).

2 Thirty-three bolts to 180 - 200 lb-in. (20.337 - 22.597 N.m).

(19) If not done, attach PWA 25926 Adapters to two PWA 25757 Pedestals. Put the tool brackets at the sides of the intermediate case in the pedestals.

(20) Remove the eye, hoists, sling, and four PWA 76154 Adapters and PWA 86567 Adapters from the fan unit.

(21) Remove the PWA 85785 Adapter from the front fan hub as follows. See Figure 401.

(a) Loosen the wing nuts.

(b) Turn the tool legs inward.

(c) Remove the adapter.

(22) Remove the PWA 88204 Guide from the LPT shaft. See Figure 403.

(23) Remove PWA 85631 Guide from the LPT shaft. Use PWA 85471 Wrench.

(24) Remove PWA 85585 Guide Ring from the 1.5 bearing support assembly. See Figure 401.

(25) Connect the gearbox driveshaft and the front housing to the angle gearbox as follows. See Figure 407.

(a) Move the retaining ring to the front of the driveshaft.

(b) Carefully push the driveshaft forward to mate with the internal splines in the angle gearbox.

(c) If the splines of the gearbox driveshaft and angle gearbox are not aligned, turn the gearshaft in the main gearbox. Refer to the procedure in a paragraph before this one.

(d) If you removed the manual crank pad cover, install it as follows. See Figure 409.

1 Lubricate with Engine Oil P03-001 a packing.

2 Install the packing on the cover (manual crank).

3 Install the cover in the main gearbox.

4 Lubricate with Antiseize Paste P06−054 two bolts. Wipe off unwanted paste.

5 Install two washers and the two bolts.

6 Torque the bolts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(e) Install the retaining ring in the internal groove of the angle gearbox.

(f) Attach the front housing to the angle gearbox as follows.

1 Lubricate with Antiseize Paste P06−054 the threads of six nuts. Wipe off unwanted paste.

2 Attach the front housing and brackets to the angle gearbox with two bolts, two washers, and two of the nuts.

3 Attach the front housing to the angle gearbox with four bolts, eight washers, and four nuts.

4 Torque the bolts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(g) Attach the front housing brackets to the HPC as follows.

1 Lubricate with Engine Oil P03−001 the threads of four bolts.

2 Attach the brackets to the HPC with the four bolts.

3 Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

4 Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the bolts.

(26) If removed, install the stator vane actuator and support assembly as follows.

(a) (Pre SB PW4ENG 72−534) Install the actuator and support assembly to the HPC case brackets and lugs. Install the two upper studs and the four nuts, lubricated with Engine Oil P03−001. Torque the nuts to 65 − 85 lb−in. (7.344 − 9.604 N.m) and install the cotter pins. See Standard Practices Manual, PN 585005, 70−53−00. See Figure 410.

(b) (Post SB PW4ENG 72−534) Install the actuator and support assembly to the HPC case bracket and lugs. Install two expandable studs (called studs) to upper attaching points on support assembly. See Figure 411 (Sheet 1) and Figure 411 (Sheet 2).

NOTE: Installation of the stud to the front attachment lug may require that the 5th stage unison ring be rotated so that the hole in the clevis is in line with the hole in the support assembly and the lug of the front compressor case. This will allow the stud to pass through the hole in the clevis and into the support assembly and the lug on the case.

(c) Lubricate the threads of the nuts with Engine Oil P03−001. Install a washer and a lubricated nut to each end of the studs. Center the studs so that an approximate equal length projects from the front and rear of the front compressor attachment points. Tighten the nuts fingertight.

(d) (Reference 739) Use a 3/32 inch (2.381 mm) hexagonal wrench in the end of the stud to prevent rotation during the torque process. Alternately torque each nut approximately one−half turn until a torque of 55 − 70 lb−in. (6.214 − 7.909 N.m) is obtained and a slot in the nuts is aligned with the cotter pin hole in the studs.

(e) After final torque of the nuts, do an inspection to ensure the following:

1 That a gap exists between the washer and the front compressor attachment points on one or both sides. Replace the stud if the total gap is less than 0.005 inch (0.127 mm). Total gap is the gap at both ends added together, or if only one gap, a gap at either end. See Figure 410 and Figure 411.

2 That the cotter pin holes are located entirely in the slot of the nuts.

3 That the stud end projection is approximately equal at both ends, plus or minus one thread beyond the outboard end of each nut.

(f) Install a cotter pin to secure each nut. Secure four cotter pins. See Standard Practices Manual, PN 585005, 70-53-00.

(g) Install the two lower bolts, lubricated with Engine Oil P03-001, and the two nuts as shown. Torque the nuts to 125 - 170 lb-in. (14.123 - 19.207 N.m). Install the lockwire through each castellated nut and wire hole in bolt threads. Twist the lockwire and wrap around the support and twist again. See Figure 411.

NOTE: The lockwire will prevent the bolts from turning.

(h) (Reference 618) Install the bolt, lubricated with Engine Oil P03-001, through the brace and support with the washer between the brace and support. Install the washer and nut on the bolt. Tighten the nut until a cotter pin slot aligns with the cotter pin hole in the bolt. Hold the head of the bolt against the brace. Measure the clearance from the nut and washer to the bracket. Measure the distance from the brace and washer to the support. Install shims (0-15AR) to get a clearance of 0.008L - 0.008T inch (0.203L - 0.203T mm) on each side of the support. Install and torque the nut 50 - 80 lb-in. (5.649 - 9.039 N.m). Install the cotter pin.

(27) If removed, install the turbine case cooling (TCC) air valve actuator as follows. See Figure 412.

(a) Position and hold actuator clear of pins on bracket on HPC case.

(b) Connect cable end to actuator piston shaft. Position actuator on bracket with pins engaging holes in actuator mount rails.

(c) Secure actuator in place with four bolts, threads lubricated with Engine Oil P03-001, and nuts (if equipped). Torque clamp bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(d) Secure ground strap to threaded hole on rear face of actuator with bolt, threads lubricated with Engine Oil P03-001. Torque bolt to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(28) Lubricate cable coupling nut threads with Engine Oil P03-001, and torque nut to 100 - 125 lb-in. (11.298 - 14.123 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

(29) Secure cable rod end bearing to valve idler arm at turbine case cooling (TCC) air shutoff valve (HPT) with bolt, threads lubricated with Engine Oil P03-001, and nut. Torque nut to 36 - 40 lb-in. (4.067 - 4.519 N.m).

D. Procedure - Connect The Tubes
Figure 413 for the right side and Figure 414 for the left side.

(1) Connect the EEC PB sensing tube (AS20) at 12:30 o'clock position as follows. See Figure 413 (Sheet 1).

(a) Do not lubricate the tube threads.

(b) (Reference 2165) Tighten and torque the tube nut to 90 - 110 lb-in. (10.169 - 12.428 N.m).

(c) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

(2) Connect the HPC air valve supply (AA25) and signal tube (AA01) to the solenoid adapters at 1 o'clock position as follows.

(a) Apply Antiseize Paste P06-054 to the threads of both solenoid tube adapters. Wipe off unwanted paste.

(b) Tighten and torque the supply tube nut (larger) to 225 - 250 lb-in. (25.422 - 28.246 N.m).

(c) Tighten and torque the signal tube nut (smaller) to 200 - 225 lb-in. (22.597 - 25.422 N.m).

(d) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

(3) Connect the No. 3 bearing air cooler tubes (AP33) and (AP34) to the cooler at 2:30 o'clock position as follows.

(a) Apply Antigalling Compound P06-021 to the threads of both air cooler adapters. See Figure 413 (Sheet 2).

(b) Tighten and torque both tube nuts to 825 - 900 lb-in. (93.212 - 106.686 N.m).

(c) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nuts.

CAUTION: DO NOT USE LUBRICANTS ON THE SUPPLEMENTAL CONTROL UNIT (SCU) SENSING TUBES, ADAPTERS OR PACKINGS. LUBRICANTS CAN CAUSE CONTAMINATION OF THE SCU.

(4) For engines with the supplemental control unit (SCU) with multiplexing, install the PT2.5 sensing tube assembly (AS35) as follows. See Figure 413 (Sheets 3 through 5).

(a) Remove the protection covers.

(b) Attach the (AS35) tube to brackets on Flange E at the 4:30 and 5:00 o'clock positions with clamps and bolts, threads lubricated with Engine Oil P03-001 and tighten by hand.

(c) Install the upper PT2.5 sensing tube assembly (AS30) as follows.

(d) Remove the protection covers.

(e) For engines equipped with the supplemental control unit (SCU) with multiplexing, install the (AS30) tube to the (AS35) tube assembly and tighten the tube nut by hand.

(f) Install clamps to the (AS30) tube and attach the clamps to brackets on Flange E with four bolts and a nut. Lubricate the threads with Engine Oil P03-001. Torque the bolts and a nut to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(g) (Reference 2165) Torque the upper tube nut to the (AS29) tube coupling at 1 o'clock position to 90 - 110 lb-in. (10.169 - 12.428 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

(h) For engines not equipped with the supplemental control unit (SCU) with multiplexing, install a cap assembly to the lower end of the (AS30) tube. Torque the cap assembly 135 - 150 lb-in. (15.2453 - 16.948 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the cap assembly.

(5) For engines not equipped with the supplemental control unit (SCU) with multiplexing, do as follows.

(a) Torque the bolts that attach the (AS35) tube to brackets on Flange E to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(b) Torque the tube nut (AS35) to the tube coupling tube (AS30) to 135 - 150 lb-in. (15.253 - 16.948 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the tube nut.

NOTE: The manifold (AS31) is installed and torqued with the transducer (N1) multiplexer input probe.

(6) Install the three bleed valve supply tubes (AA26), (AA27) and (AA29) as follows. See Figure 413 (Sheets 6 and 7).

(a) Remove the protective covers.

(b) Lubricate all the tube nut and coupling threads with Antiseize Paste P06-054. Wipe off unwanted paste.

(c) Install the inboard tube (AA26) (supply) to the upper tube nut at 2 o'clock position and to the solenoid adapter at 5 o'clock position. Attach the tube nut to the tube tee adjacent to the solenoid.

(d) Install the middle tube (AA27) (left supply) to the tube coupling at 2 o'clock position and to the tube coupling adjacent to the solenoid at 5 o'clock position.

(e) Install the outboard tube (AA29) (right supply) to the tube nut at 2 o'clock position and to the solenoid adapter at 5 o'clock position.

(f) Install the clamp bolts, lubricated with Engine Oil P03-001, spacer, and nut, that attach the tubes to the brackets and to each other. Torque the clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(g) Torque the lower tube nut of the inboard tube to the larger solenoid adapter to 225 - 250 lb-in. (25.422 - 28.246 N.m). Torque all of the remaining tube nuts to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety all the tube nuts.

(7) Install the fuel distribution valve supply tube (FM09) as follows. See Figure 413 (Sheet 8).

(a) Remove the protective covers.

R (b) Install the two packings PN 227433, lubricated
R with Engine Oil P03-001 or Sealing Ring Lubricant
R P06-053 and retainers PN 354120.

(c) Install the tube to fuel flowmeter and to the fuel metering unit. Tighten by hand.

(d) Install the clamp bolt, lubricated with Engine Oil P03-001, and attach the clamp to the HPC case bracket. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(e) Torque the tube nuts to 100 − 110 lb−in. (11.298 − 12.428 N.m). Loosen the tube nuts and torque them again to the same limits. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the nuts.

(8) Install the hydraulic pressure manifold (CP05) and oil cooler inlet return manifold (CR01) as follows. See Figure 413 (Sheet 9).

(a) Remove the protective covers.

(b) Lubricate all the manifold coupling and tube nut threads with Antiseize Paste P06−054. Wipe off unwanted paste.

(c) Install the two manifolds to the two hoses at 3 o'clock position and to the manifolds at 5 o'clock position.

(d) Install the clamp bolts, lubricated with Engine Oil P03−001, and nut, that attach the manifolds to the engine brackets. Torque the clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(e) Torque the return manifold nuts (smaller) at each end to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the nuts.

(f) Torque the pressure manifold nuts (larger) at each end to 340 − 375 lb−in. (38.415 − 42.369 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the nuts.

(9) Install the compressor stator cylinder hydraulic pressure and return tubes (CP12) and (CR03) as follows. See Figure 413 (Sheet 9).

(a) Remove the protective covers.

(b) Lubricate the tube nut threads of both tubes with Antiseize Paste P06−054. Wipe off unwanted paste.

(c) Install the two tubes to the manifold tees and the cylinder adapters.

(d) Install the two clamp bolts, lubricated with Engine Oil P03-001, that attach the tubes to the Flange E bracket. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(e) Torque the return tube nuts (smaller) to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nuts.

(f) Torque the pressure tube nuts (larger) to 225 - 250 lb-in. (25.422 - 28.246 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nuts.

CAUTION: MAKE SURE YOU CONNECT THE TUBES TO THE CORRECT CONNECTORS OR FAULT MESSAGES WILL BE GENERATED.

(10) Install the (IDG) air/oil cooler valve hydraulic pressure (CP13) and return (CR12) tubes to the IDG heat exchanger at 4 o'clock position as follows. See Figure 413 (Sheet 10).

(a) Remove the protective covers.

(b) Lubricate the (IDG) air/oil cooler valve hydraulic pressure and return tube nut threads with Antiseize Paste P06-054. Wipe off unwanted paste.

(c) Install the two tubes to the manifold tees and heat exchanger adapters.

1 Install the CR12 tube to the adapter that is furthest from the lower triangular pad on the exchanger. Install the CP13 tube to the adapter that is closest to the lower triangular pad on the exchanger. Connect tube nut to heat exchanger adapter.

(d) Torque the two return tube nuts and the one smaller pressure tube nut to 200 - 225 lb-in. (22.597 - 25.422 N.m). Torque the one pressure tube nut (larger) to the manifold tee to 340 - 375 lb-in. (38.415 - 42.369 N.m).

(e) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nuts.

(11) Install the airframe (IDG) cooler outlet oil tube (LS03) as follows. See Figure 413 (Sheet 10).

(a) Remove the protective covers.

R (b) Install a packing, lubricated with Engine Oil
R P03-001 or Sealing Ring Lubricant P06-053 to the
R packing groove at the flanged end of the tube.

(c) Lubricate the tube nut threads with Antiseize Paste P06-054. Wipe off unwanted paste.

(d) Install the tube with the three bolts, lubricated with Engine Oil P03-001 to the heat exchanger. Tighten the tube nut by hand. Torque the three bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m). Torque the tube nut to 675 - 750 lb-in. (76.265 - 84.739 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut and bolts.

(12) Connect the angle gearbox oil pressure tube (LP09) to the angle gearbox at 6 o'clock position as follows. See Figure 413 (Sheet 11).

(a) Apply Antiseize Paste P06-054 to the threads of the mating tube adapter on the angle gearbox. Wipe off unwanted paste.

(b) Tighten and torque the tube nut to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

(13) Connect the angle gearbox oil scavenge tube (LR01) to the angle gearbox at 6 o'clock position as follows.

R (a) Remove the protective covers. Install a new
R packing, lubricated with Engine Oil P03-001 or
R Sealing Ring Lubricant P06-053 to the groove at
R the flanged end.

(b) Engage the flanged end into the angle gearbox boss. Install the two bolts, lubricated with Engine Oil P03-001. Tighten and torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(c) Install and torque all the clamp bolts that attach the tube to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(14) Install the 2.5 bleed valve cylinder hydraulic pressure (CP06) and return (CR02) tubes at 7 o'clock position as follows. See Figure 414 (Sheet 1).

(a) Remove protective covers.

(b) Apply Engine Oil P03-001 to the bleed valve cylinder return tube nut threads (smaller diameter tube).

(c) Install the tube. Tighten and torque the tube nuts to 270 - 300 lb-in. (30.506 - 33.895 N.m).

(d) Apply Antiseize Paste P06-054 to the bleed valve cylinder hydraulic pressure tube nut threads (largest diameter tube). Wipe off unwanted paste.

(e) Install the tube. Torque the tube nut attached to the manifold tee to 340 - 375 lb-in. (38.415 - 42.369 N.m). Torque the tube nut attached to the actuator to 225 - 250 lb-in. (25.422 - 28.246 N.m).

(f) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nuts.

(15) Connect the No. 1, 1.5, and 2 bearing oil scavenge tube (LR02) at the 7:30 o'clock position as follows. See Figure 414 (Sheet 2).

(a) Apply Engine Oil P03-001 to the tubes mating coupling threads.

(b) Tighten and torque the tube nut to 1300 - 1400 lb-in. (146.880 - 158.179 N.m).

(c) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

(16) Install the (left) air/oil cooler hydraulic pressure (CP07) and return (CR05) tubes as follows. See Figure 414 (Sheet 2).

(a) Remove the protective covers.

(b) Lubricate the tube nut threads of both tubes with Antiseize Paste P06-054. Wipe off unwanted paste.

(c) Install the tubes to the heat exchanger adapters and the manifold tees. Install the clamp bolt, lubricated with Engine Oil P03-001, that attaches the pressure tube to the Flange E bracket. Torque the clamp bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(d) Torque the one (larger) hydraulic pressure tube nut to the manifold tee to 225 - 250 lb-in. (25.422 - 28.246 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

(e) Torque the three remaining (smaller) tube nuts to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nuts.

CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTION USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF THE TUBE OR AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE EXTERNAL WIRE BRAID AND IN THE INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(17) Install the (left) air/oil cooler outlet oil hose and tube assembly (LP03) as follows. See Figure 414 (Sheet 3).

(a) Remove the protective covers.

(b) Apply wet Zinc Chromate Primer P18-003 to the mating surface of the flange end. Do not apply any primer to the raised portion near the packing groove. Let it air dry for 10 minutes before assembly.

R (c) Install a new packing, lubricated with Engine Oil
R P03-001 or Sealing Ring Lubricant P06-053 to the
R packing groove at the flanged end.

R (d) Install a new packing, lubricated with Engine Oil
R P03-001 or Sealing Ring Lubricant P06-053 and
R retainer to the nut end of the tube.

(e) Lubricate the tube nut threads with Antigalling Compound P06-021 and install the tube to the fuel/oil cooler bypass valve and the air/oil heat exchanger.

(f) Attach the flanged end with the two inboard bolts, lubricated with Engine Oil P03-001. Tighten by hand.

(g) Install the clamp bolt, lubricated with Engine Oil P03-001, that attaches the tube to the HPC case bracket. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(h) Torque the tube nut to 200 - 220 lb-in. (22.597 - 24.857 N.m). Loosen the tube nut and torque it again to the same limit. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

NOTE: Torque the bolts at the forward end with the installation of the oil inlet tube.

(18) Install the (left) air/oil cooler inlet oil tube (LP02) as follows. See Figure 414 (Sheet 3).

(a) Remove the protective covers.

R (b) Install the two new packings, lubricated with
R Engine Oil P03-001 or Sealing Ring Lubricant
R P06-053 to the tube ends.

(c) Install the tube to the heat exchanger and the main oil filter housing. Install the six bolts, lubricated with Engine Oil P03-001, that attach the tube.

(d) Install the bolt, lubricated with Engine Oil P03-001, and attaches the harness bracket to the tube. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(e) Torque the eight bolts that attach the two tube flanges to the heat exchanger and the one tube flange to the main oil filter housing to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(19) Install the main bearing oil pressure tube (LP05) to the last−chance strainer housing at 9 o'clock position as follows. See Figure 414 (Sheet 4).

(a) Remove the protective cover.

R (b) Install a new packing, lubricated with Engine Oil P03−001 or Sealing Ring Lubricant P06−053 and retainer to the tube.

(c) Lubricate the tube nut threads with Antiseize Paste P06−054. Wipe off unwanted paste.

(d) Install the tube to the strainer housing adjacent to Flange E and above the fuel/oil cooler.

(e) Install the two clamp bolts, lubricated with Engine Oil P03−001, that attach the tube and the strainer housing to Flange E. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(f) Torque the forward tube nut to 675 − 750 lb−in (76.265 − 84.739 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the nut.

(g) Torque the rear tube nut to 140 − 160 lb−in. (15.818 − 18.078 N.m). Loosen the tube nut and torque it again to the same limits. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the nut.

(20) Connect the HPC air valve and air shutoff valve supply (AA22) and the signal tubes (AA06) and (AA18) to the solenoid at 10 o'clock position as follows. See Figure 414 (Sheet 4).

(a) Apply Antiseize Paste P06−054 to the adapter threads on the solenoid. Wipe off unwanted paste.

(b) Tighten and torque the (largest diameter) supply tube nut to 225 − 250 lb−in. (25.422 − 28.246 N.m).

(c) Tighten and torque the two (smaller diameter) signal tubes to 200 − 225 lb−in. (22.597 − 25.422 N.m).

(d) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nuts.

(21) Connect the main bearing breather tube (LB06) at 11:30 o'clock position as follows. See Figure 414 (Sheet 5).

(a) Apply Antiseize Paste P06-054 to the upper tube coupling threads. Wipe off unwanted paste.

(b) Tighten and torque the tube nut to 1150 - 1300 lb-in. (129.933 - 146.880 N.m).

(c) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

(22) Connect the EEC PT4.95 tube (AS04) at 11:30 o'clock position as follows. See Figure 414 (Sheet 5).

(a) Do not lubricate tube threads.

(b) Tighten and torque the tube nut to 270 - 300 lb-in. (30.506 - 33.895 N.m).

(c) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

E. Connect The Wiring Harnesses

CAUTION: SEE 72-00-00, INSTALLATION-00 (TASK 72-00-00-990-008) AND (TASK 72-00-00-990-009) FOR NECESSARY GENERAL INSTALLATION INSTRUCTIONS ABOUT THE WIRING HARNESSES, LEADS, AND CABLES.

CAUTION: DO NOT TWIST OR BEND THE HARNESSES BADLY DURING INSTALLATION OR DAMAGE TO THE HARNESSES CAN RESULT.

(1) If removed, install the W3, W4, and W5 harnesses to the core-unit as follows. See Figure 415.

(a) Install the harness support bracket (upper) to the bracket on the fuel/oil cooler and the HPC case bracket. Attach the support bracket with the bolt and nut, lubricated with Engine Oil P03−001. Torque the bolt and nut to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(b) Connect all the W3, W4, and W5 harness connectors (given below) to the mating harness receptacles as follows. For each connector:

1 Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary,
R carefully make straight all the bent pins. If
R necessary, clean the connector and receptacle
R by SPOP 6 (Task 70−21−00−110−900). Refer to
R Section 70−21−00 in the Standard Practices
R Manual, PN 585005.

2 Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

3 Use the Glenair TG−70 Strap Wrench or the Glenair TG−69 Soft−Jawed Pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- The connector coupling nut is fully tight
- The connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts

are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque. See the instructions given with the strap wrench for correct use.

4 Attach the W4J25 connector, the W5J26 connector, and the W3J24 connector to the HPC case brackets. Install the connector retaining brackets and bolts, lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

5 Connect the W4P16 connector to the TCC air valve actuator.

6 Connect the W5P7 connector and the W4P3 connector to the stator vane actuator.

7 Install the clamp bolts, lubricated with Engine Oil P03−001, and nuts that attach the W3, W4, and W5 harnesses to the engine brackets. See Figure 415. Torque the clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(2) Install the W2 harness to the core−unit as follows. See Figure 416

(a) Remove the lockwire that attaches the W2 harness to the 12 o'clock strut. Adjust the harness in position.

(b) Connect the W2P26 harness connector to the harness receptacle on the HPC case bracket at 12 o'clock position as follows.

1 Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary,
R carefully make straight all the bent pins. If
R necessary, clean the connector and receptacle
R by SPOP 6 (Task 70−21−00−110−900). Refer to
R Section 70−21−00 in the Standard Practices
R Manual, PN 585005.

2 Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

3 Use the Glenair TG-70 Strap Wrench or the Glenair TG-69 Soft-Jawed Pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- The connector coupling nut is fully tight
- The connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque. See the instructions given with the strap wrench for correct use.

(c) Attach the W2J9 harness receptacle to the HPC case bracket at 12 o'clock position. Install the retaining bracket and the two bolts, lubricated with Engine Oil P03-001. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(d) Install the clamp bolts, lubricated with Engine Oil P03-001, and nuts that attach the W2 harness to the Flange E bracket and the No. 1, 1.5 and 2 bearing breather tube. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(3) Install the W1 harness to the core engine as follows. See Figure 416.

(a) Remove the lockwire that attaches the W1 harness to the 12 o'clock strut. Adjust the harness in position.

(b) Connect the W1 harness connectors (given below) to the mating harness receptacles as follows. For each connector:

1 Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary,
R carefully make straight all the bent pins. If
R necessary, clean the connector and receptacle
R by SPOP 6 (Task 70-21-00-110-900). Refer to
R Section 70-21-00 in the Standard Practices
R Manual, PN 585005.

2 Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

3 Use the Glenair TG-70 Strap Wrench or the Glenair TG-69 Soft-Jawed Pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- The connector coupling nut is fully tight
- The connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts

are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque. See the instructions given with the strap wrench for correct use.

- Connect the W1P25 harness connector to the receptacle on the HPC case bracket at 1 o'clock position and tighten.
- Connect the W1P11 and W1P10 harness connectors to the 1 o'clock position solenoid and tighten. Install the clamp bolts, lubricated with Engine Oil P03-001, and nuts that attach the W1 harness to the solenoid muscle tube and the Flange E bracket. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).
- Connect the W1P24 harness connector to the receptacle on the HPC case bracket at 10 o'clock position and tighten.
- Connect the W1P9 harness connector to the receptacle on the HPC case bracket at 12 o'clock position and tighten.
- Connect the W1P12 harness connector to the solenoid at 10 o'clock position and tighten.

(c) Install the clamp bolts, threads lubricated with Engine Oil P03-001, and nuts that attach the W1 harness to the HPC case brackets. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(4) Install the other harnesses as follows. See Figure 417.

(a) Attach the (IDG)-heat-exchanger harness receptacle to the HPC case bracket at 4 o'clock position. Install the retaining plate and the two bolts, lubricated with Engine Oil P03-001. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m). Install the clamp bolts, lubricated with Engine Oil P03-001, and nuts that attach the harness to the hydraulic tube. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(b) Attach the (engine)−air/oil−heat−exchanger−harness receptacle to the HPC case bracket at 7:30 o'clock position. Install the retaining plate and the two bolts, lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) Connect the harness connectors (given below) to the harness receptacles as follows. For each connector:

1 Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary,
R carefully make straight all the bent pins. If
R necessary, clean the connector and receptacle
R by SPOP 6 (Task 70−21−00−110−900). Refer to
R Section 70−21−00 in the Standard Practices
R Manual, PN 585005.

2 Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

3 Use the Glenair TG−70 Strap Wrench or the Glenair TG−69 Soft−Jawed Pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- The connector coupling nut is fully tight
- The connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts

are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

- Connect the W4P4 and W5P11 harness connectors to the solenoid at 5 o'clock position and tighten. Install the clamp bolt, lubricated with Engine Oil P03-001, and nut that attach the W4 harness to the bleed-valve-supply-tube. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).
- Connect the W3P15 harness connector to the 2.5 bleed valve actuator at 7 o'clock position and tighten.
- Connect the W3P17 harness connector to the receptacle on the HPC case bracket at 7:30 o'clock position and tighten.

F. Postrequisites

(1) If the variable stator vane control system was removed or disturbed, rig the system. See 72-00-00, Special Procedures-05 (Task 72-00-00-830-003-A00) or (Task 72-00-00-830-003-B00).

(2) If the turbine case cooling (TCC) air valve actuator was removed or disturbed, rig the actuator. See 72-00-00, Special Procedures-06 (Task 72-00-00-830-004).

(3) Refer to Table 401 for the installation procedures that are postrequisite to this procedure.

Step	Install The	Chapter/ Section	Installation
1	LPC/LPT Coupling	72-00-32	01 (Task 72-00-32 420-001)
2	Compressor Inlet Cone	72-00-31	02 (Task 72-00-31-420-001)

Other Post requisite Procedures
Table 401

ENGINE GENERAL − INTERMEDIATE CASE − INSTALLATION−21

Task 72−00−34−420−006:

1. Install The Fan Unit On The Core Engine

A. Prerequisites

(1) If disassembled, install the HPC top front case. See 72−00−35, Installation−18 (Task 72−00−35−430−001).

(2) If applicable, trunnion the fan unit from rear end down to horizontal position. Refer to 72−00−00, Special Procedures−22 (Task 72−00−00−420−004).

B. Equipment And Materials Necesary

Standard Tools:
Glenair TG−70 Strap Wrench or
Glenair TG−69 Soft Jawed Pliers
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 25757	Pedestal (2 Necessary)
PWA 25926	Adapters (2 Necessary)
PWA 29855−7	Pins, Aligning (2 Necessary)
PWA 76154	Adapter (2 Necessary)
PWA 76155	Sling
PWA 85260	Pins, Aligning (2 Necessary)
PWA 85429	Wrench
PWA 85471	Wrench, Torque
PWA 85537	Fixture, Handling
PWA 85585	Ring, Guide
PWA 85623	Eye, Lifting
PWA 85631	Guide, Piloting
PWA 85768	Puller
PWA 85785	Adapter, Piloting
PWA 86209	Retainer, Positioning (Optional To PWA 85537)
PWA 86598	Retainer, Positioning (Optional To PWA 86209)
PWA 88204	Guide, Piloting

R
R

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
	P05-292	Ferrule, Safety Cable (Optional)
R	P06-021	Compound, Antigalling (PWA 550-3)
R	P06-053	Lubricant, Sealing Ring (PWA 36500)
R	P06-054	Paste, Antiseize (PWA 36246)

Expendable Parts:

Lockwire, MS9226-06		

C. Procedure - Install The Fan Unit To The Core Engine

(1) If installed, remove the turbine shaft nut and washer from the front of the LPT shaft. Use PWA 85429 Wrench. See Figure 401.

(2) If not installed, install PWA 85585 Guide Ring on the No. 1.5-bearing-support-assembly with detail screws. See Figure 402.

(3) If not installed, install PWA 85785 Adapter to the front of the fan hub as follows.

(a) Move the legs of the adapter to their outermost position.

(b) Engage the rear of the fan hub.

(c) Tighten the wing nuts to hold the legs in position.

(4) If not installed, install the PWA 88204 Guide in the front of the LPT shaft on the core-unit. Tighten by hand. See Figure 403.

CAUTION: DO NOT SUPPORT THE FRONT OF THE CORE-UNIT BY THE PWA 85631 GUIDE YOU INSTALL ON THE FRONT OF THE UNIT. DO NOT PUT ANY FORCE OR STRESS ON THE GUIDE. TOO MUCH STRESS ON THE GUIDE CAN CAUSE DAMAGE TO THE PLAIN ROUND NUT.

(5) If not installed, install PWA 85631 Guide as follows.

(a) Install the guide in the plain round nut. Be sure the threads engage correctly.

(b) Use PWA 85471 Wrench and tighten the guide until seated.

NOTE: If equipped, the four grooves on the PWA 85631 Guide Change B, must be fully rearward of the PWA 85585 Guide Ring front surface. If the grooves are not fully rearward of the ring, the threads of the guide are not fully engaged.

(6) If not installed, attach PWA 85623 Eye to the intermediate case at 12 o'clock with the detail screws. See Figure 404.

(7) Support the engine with hoists at:

(a) The front of the fan unit. Use, in addition to a hoist and PWA 86567 Adapters, PWA 76155 Sling and two PWA 76154 Adapters.

(b) The rear of the fan unit: PWA 85659 Eye.

NOTE: There is already a Hoist and PWA 85390 Adapters that support the center of the core-unit.

(8) If installed, remove PWA 85537 Fixture or PWA 86598 Retainer or PWA 86209 Retainer. See Figure 405.

(9) If installed, remove the pedestals from the fan unit.

R
R

(10) For engines that have incorporated SB PW4ENG 72-48, install a packing on the rear of the intermediate case as follows. See Figure 406.

R (a) Lubricate a packing with Engine Oil P03-001 or Sealing Ring Lubricant P06-053.

(b) Install the packing.

R (11) Lubricate a packing with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 and install it on the No. 2 bearing support assembly.

R (12) Install the transfer tube and the new packings, lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 to the No. 2 bearing support.

(13) Install PWA 85260 Aligning Pins in the intermediate case. See Figure 406.

(a) Install them at 3 and 9 o'clock positions.

(b) Install them in the Flange E boltholes.

(14) Install PWA 29855-7 Aligning Pins in the intermediate case. See Figure 406.

(a) Install them at 6 and 12 o'clock positions.

(b) Install them in the Flange E boltholes.

(15) Install the gearbox-driveshaft-(front)-housing (called front housing) and the gearbox driveshaft in the gearbox driveshaft housing (called rear housing) as follows. See Figure 407.

R (a) Lubricate the two packings with Engine Oil P03-001 or Sealing Ring Lubricant P06-053. Install the packings on the front and rear of the front housing.

(b) Install the front housing in the rear housing. Push the front housing to the rear.

(c) Install the gearbox driveshaft in the rear housing as follows.

1 Make sure that the retaining ring is on the gearbox driveshaft.

2 Mate the gearbox driveshaft splines with the splines of the gearshaft in the main gearbox.

3 Carefully push the gearbox driveshaft to the rear.

(16) Remove the protective caps, plugs, and covers from the openings on the rear of the fan−unit at:

(a) The EEC PB sensing tube nut at 12:30 o'clock position.

(b) The tube adapters of the three solenoids at 1, 5, and 10 o'clock positions.

(c) The No. 3−bearing−air−cooler−adapters at 2:30 o'clock position.

(d) The bleed−valve−supply tube nut and tube coupling at 5 o'clock position.

(e) The angle−gearbox−oil−pressure adapter on the angle gearbox at 6 o'clock position.

(f) The cooling−air−tube adapter at 6:30 o'clock position.

(g) The 1, 1.5, and 2 main−bearing−oil−scavenge−tube coupling at 7:30 o'clock position.

(h) The main−bearing−oil−breather−tube nut at 11:30 o'clock position.

(i) The EEC PT4.95 sensing tube nut at 11:30 o'clock position.

(17) Remove the protective caps, plugs, and covers from the openings on the front of the core−unit at:

(a) The EEC PB sensing tube coupling at 12:30 o'clock position.

(b) The tube nuts that attach to the three solenoids at l, 5, and 10 o'clock positions.

(c) The two No. 3−bearing−air−cooler−tube nuts at 2:30 o'clock position.

(d) The bleed-valve-supply-tube nut and adapter at 5 o'clock position.

(e) The angle-gearbox-pressure-tube nut at 6 o'clock position.

(f) The No. 1, 1.5, and 2 bearing-oil-scavenge-tube nut at 7:30 o'clock position.

(g) The main-bearing-oil-breather-tube coupling at 11:30 o'clock position.

(h) The EEC 4.95 sensing tube coupling at 11:30 o'clock position.

(18) Put the fan unit and the core engine together as follows. See Figure 408.

CAUTION: BE SURE TO ALIGN THE CORE-UNIT AND FAN-UNIT ACCURATELY. DO NOT PERMIT THE PWA 85631 GUIDE ON THE FRONT OF THE CORE-UNIT TO TOUCH THE NO. 2 BEARING CARBON SEAL. DAMAGE TO THE SEAL CAN RESULT.

CAUTION: DO NOT SUPPORT THE FRONT OF THE CORE-UNIT BY THE PWA 85631 GUIDE THAT IS INSTALLED ON THE FRONT OF THE CORE-UNIT. DO NOT PUT ANY FORCE OR STRESS ON THE GUIDE. TOO MUCH STRESS ON THE GUIDE CAN CAUSE DAMAGE TO THE PLAIN ROUND NUT.

(a) Be sure the dowel pin on the front of the No. 2 bearing support is aligned with the dowel pin hole in the No. 1.5 bearing support flange.

(b) Be sure the oil transfer tube will engage the hole in the tube connector in the No. 1.5 bearing support assembly.

(c) Be sure the bevel gear on the LPT shaft is aligned with the bevel gear in the intermediate case. See Figure 407. If not, turn the gear in the HPC as follows.

1 Remove two bolts and washers that attach the manual crank cover to the scavenge pump drive bearing housing assembly. See Figure 409.

2 Remove the cover (manual crank) with PWA 85768 Puller. See Figure 409.

3 To align the bevel gears, turn the gearshaft in the main gearbox with a wrench through the crank pad. See Figure 409.

(d) Carefully align and install the fan-unit to the core-unit until Flange E is almost together. Be sure the distance between the fan-unit and the core-unit at Flange E is approximately the same all around. At the same time, be very careful to correctly engage the bevel gears, oil transfer tube, and dowel pin.

(e) Engage the diameters of the intermediate case and the HPC.

(f) Lubricate with Engine Oil P03-001 33 bolts (No. 1.5 bearing support assembly).

(g) Remove the four workbolts that are in the 33 bolt circle of the No. 1.5 bearing support assembly. Install 33 bolts in the boltholes.

(h) Install the Flange E hardware as follows. Refer to 72-00-34, Installation-20 (Task 72-00-34-420-020)..

NOTE: Flange E has two configurations, the UPS configuration has 72 bolts and the other configuration has 74 bolts.

1 For engines with the 2.5 bleed actuator support bracket (Post SB PW4ENG 75-84), attach the support bracket to a bracket on Flange E with three nuts and bolts, threads lubricated with Engine Oil P03-001. Torque the nuts 85 - 95 lb-in. (9.604 - 10.734 N.m).

(i) At the same time, tighten the bolts in the 33 bolt No. 1.5 bearing support assembly and Flange E.

(j) Torque:

1 Flange E bolts to 225 - 250 lb-in. (25.422 - 28.246 N.m).

2 No. 1.5 bearing support assembly bolts to 180 - 200 lb-in. (20.337 - 22.597 N.m).

(19) If not done, attach PWA 25926 Adapters to two PWA 25757 Pedestals. Put the tool brackets at the sides of the intermediate case in the pedestals.

(20) Remove the eye, hoists, sling, and four PWA 76154 Adapters and PWA 86567 Adapters from the fan unit.

(21) Remove the PWA 85785 Adapter from the front fan hub as follows. See Figure 401.

(a) Loosen the wing nuts.

(b) Turn the tool legs inward.

(c) Remove the adapter.

(22) Remove the PWA 88204 Guide from the LPT shaft. See Figure 403.

(23) Remove PWA 85631 Guide from the LPT shaft. Use PWA 85471 Wrench.

(24) Remove PWA 85585 Guide Ring from the 1.5 bearing support assembly. See Figure 401.

(25) Connect the gearbox driveshaft and the front housing to the angle gearbox as follows. See Figure 407.

(a) Move the retaining ring to the front of the driveshaft.

(b) Carefully push the driveshaft forward to mate with the internal splines in the angle gearbox.

(c) If the splines of the gearbox driveshaft and angle gearbox are not aligned, turn the gearshaft in the main gearbox. Refer to the procedure in a paragraph before this one.

(d) If you removed the manual crank pad cover, install it as follows. See Figure 409.

1 Lubricate with Engine Oil P03-001 a packing.

2 Install the packing on the cover (manual crank).

3 Install the cover in the main gearbox.

4 Lubricate with Antiseize Paste P06-054 two bolts. Wipe off unwanted paste.

5 Install two washers and the two bolts.

6 Torque the bolts to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(e) Install the retaining ring in the internal groove of the angle gearbox.

(f) Attach the front housing to the angle gearbox as follows.

1 Lubricate with Antiseize Paste P06-054 the threads of six nuts. Wipe off unwanted paste.

2 Attach the front housing and brackets to the angle gearbox with two bolts, two washers, and two of the nuts.

3 Attach the front housing to the angle gearbox with four bolts, eight washers, and four nuts.

4 Torque the bolts to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(g) Attach the front housing brackets to the HPC as follows.

1 Lubricate with Engine Oil P03-001 the threads of four bolts.

2 Attach the brackets to the HPC with the four bolts.

3 Torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

4 Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(26) If removed, install the stator vane actuator and support assembly as follows.

(a) (Pre SB PW4ENG 72−534) Install the actuator and support assembly to the HPC case brackets and lugs. Install the two upper studs and the four nuts, lubricated with Engine Oil P03−001. Torque the nuts to 65 − 85 lb−in. (7.344 − 9.604 N.m) and install the cotter pins. See Standard Practices Manual, PN 585005, 70−53−00. See Figure 410.

(b) (Post SB PW4ENG 72−534) Install the actuator and support assembly to the HPC case bracket and lugs. Install two expandable studs (called studs) to upper attaching points on support assembly. See Figure 411 (Sheet 1) and Figure 411 (Sheet 2).

NOTE: Installation of the stud to the front attachment lug may require that the 5th stage unison ring be rotated so that the hole in the clevis is in line with the hole in the support assembly and the lug of the front compressor case. This will allow the stud to pass through the hole in the clevis and into the support assembly and the lug on the case.

(c) Lubricate the threads of the nuts with Engine Oil P03−001. Install a washer and a lubricated nut to each end of the studs. Center the studs so that an approximate equal length projects from the front and rear of the front compressor attachment points. Tighten the nuts fingertight.

(d) (Reference 739) Use a 3/32 inch (2.381 mm) hexagonal wrench in the end of the stud to prevent rotation during the torque process. Alternately torque each nut approximately one−half turn until a torque of 55 − 70 lb−in. (6.214 − 7.909 N.m) is obtained and a slot in the nuts is aligned with the cotter pin hole in the studs.

(e) After final torque of the nuts, do an inspection to ensure the following:

1 That a gap exists between the washer and the front compressor attachment points on one or both sides. Replace the stud if the total gap is less than 0.005 inch (0.127 mm). Total gap is the gap at both ends added together, or if only one gap, a gap at either end. See Figure 410 and Figure 411.

2 That the cotter pin holes are located entirely in the slot of the nuts.

3 That the stud end projection is approximately equal at both ends, plus or minus one thread beyond the outboard end of each nut.

(f) Install a cotter pin to secure each nut. Secure four cotter pins. See Standard Practices Manual, PN 585005, 70−53−00.

(g) Install the two lower bolts, lubricated with Engine Oil P03−001, and the two nuts as shown. Torque the nuts to 125 − 170 lb−in. (14.123 − 19.207 N.m). Install the lockwire through each castellated nut and wire hole in bolt threads. Twist the lockwire and wrap around the support and twist again. See Figure 411.

NOTE: The lockwire will prevent the bolts from turning.

(h) (Reference 618) Install the bolt, lubricated with Engine Oil P03−001, through the brace and support with the washer between the brace and support. Install the washer and nut on the bolt. Tighten the nut until a cotter pin slot aligns with the cotter pin hole in the bolt. Hold the head of the bolt against the brace. Measure the clearance from the nut and washer to the bracket. Measure the distance from the brace and washer to the support. Install shims (0−15AR) to get a clearance of 0.008L − 0.008T inch (0.203L − 0.203T mm) on each side of the support. Install and torque the nut 50 − 80 lb−in. (5.649 − 9.039 N.m). Install the cotter pin.

(27) If removed, install the turbine case cooling (TCC) air valve actuator as follows. See Figure 412.

(a) Position and hold actuator clear of pins on bracket on HPC case.

(b) Connect cable end to actuator piston shaft. Position actuator on bracket with pins engaging holes in actuator mount rails.

(c) Secure actuator in place with four bolts, threads lubricated with Engine Oil P03−001, and nuts (if equipped). Torque clamp bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(d) Secure ground strap to threaded hole on rear face of actuator with bolt, threads lubricated with Engine Oil P03−001. Torque bolt to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(28) Lubricate cable coupling nut threads with Engine Oil P03−001, and torque nut to 100 − 125 lb−in. (11.298 − 14.123 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the nut.

(29) Secure cable rod end bearing to valve idler arm at turbine case cooling (TCC) air shutoff valve (HPT) with bolt, threads lubricated with Engine Oil P03−001, and nut. Torque nut to 36 − 40 lb−in. (4.067 − 4.519 N.m).

D. Procedure − Connect The Tubes
Figure 413 for the right side and Figure 414 for the left side.

(1) Connect the EEC PB sensing tube (AS20) at 12:30 o'clock position as follows. See Figure 413 (Sheet 1).

(a) Do not lubricate the tube threads.

(b) (Reference 2165) Tighten and torque the tube nut to 90 − 110 lb−in. (10.169 − 12.428 N.m).

(c) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the nut.

(2) Connect the HPC air valve supply (AA25) and signal tube (AA01) to the solenoid adapters at 1 o'clock position as follows.

(a) Apply Antiseize Paste P06−054 to the threads of both solenoid tube adapters. Wipe off unwanted paste.

(b) Tighten and torque the supply tube nut (larger) to 225 − 250 lb−in. (25.422 − 28.246 N.m).

(c) Tighten and torque the signal tube nut (smaller) to 200 − 225 lb−in. (22.597 − 25.422 N.m).

(d) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the nut.

(3) Connect the No. 3 bearing air cooler tubes (AP33) and (AP34) to the cooler at 2:30 o'clock position as follows.

(a) Apply Antigalling Compound P06−021 to the threads of both air cooler adapters. See Figure 413 (Sheet 2).

(b) Tighten and torque both tube nuts to 825 − 900 lb−in. (93.212 − 106.686 N.m).

(c) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the nuts.

CAUTION: DO NOT USE LUBRICANTS ON THE SUPPLEMENTAL CONTROL UNIT (SCU) SENSING TUBES, ADAPTERS OR PACKINGS. LUBRICANTS CAN CAUSE CONTAMINATION OF THE SCU.

(4) For engines with the supplemental control unit (SCU) with multiplexing, install the PT2.5 sensing tube assembly (AS35) as follows. See Figure 413 (Sheets 3 through 5).

(a) Remove the protection covers.

(b) Attach the (AS35) tube to brackets on Flange E at the 4:30 and 5:00 o'clock positions with clamps and bolts, threads lubricated with Engine Oil P03−001 and tighten by hand.

(c) Install the upper PT2.5 sensing tube assembly (AS30) as follows.

(d) Remove the protection covers.

(e) For engines equipped with the supplemental control unit (SCU) with multiplexing, install the (AS30) tube to the (AS35) tube assembly and tighten the tube nut by hand.

(f) Install clamps to the (AS30) tube and attach the clamps to brackets on Flange E with four bolts and a nut. Lubricate the threads with Engine Oil P03-001. Torque the bolts and a nut to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(g) (Reference 2165) Torque the upper tube nut to the (AS29) tube coupling at 1 o'clock position to 90 - 110 lb-in. (10.169 - 12.428 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

(h) For engines not equipped with the supplemental control unit (SCU) with multiplexing, install a cap assembly to the lower end of the (AS30) tube. Torque the cap assembly 135 - 150 lb-in. (15.2453 - 16.948 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the cap assembly.

(5) For engines not equipped with the supplemental control unit (SCU) with multiplexing, do as follows.

(a) Torque the bolts that attach the (AS35) tube to brackets on Flange E to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(b) Torque the tube nut (AS35) to the tube coupling tube (AS30) to 135 - 150 lb-in. (15.253 - 16.948 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the tube nut.

NOTE: The manifold (AS31) is installed and torqued with the transducer (N1) multiplexer input probe.

(6) Install the three bleed valve supply tubes (AA26), (AA27) and (AA29) as follows. See Figure 413 (Sheets 6 and 7).

(a) Remove the protective covers.

(b) Lubricate all the tube nut and coupling threads with Antiseize Paste P06-054. Wipe off unwanted paste.

(c) Install the inboard tube (AA26) (supply) to the upper tube nut at 2 o'clock position and to the solenoid adapter at 5 o'clock position. Attach the tube nut to the tube tee adjacent to the solenoid.

(d) Install the middle tube (AA27) (left supply) to the tube coupling at 2 o'clock position and to the tube coupling adjacent to the solenoid at 5 o'clock position.

(e) Install the outboard tube (AA29) (right supply) to the tube nut at 2 o'clock position and to the solenoid adapter at 5 o'clock position.

(f) Install the clamp bolts, lubricated with Engine Oil P03-001, spacer, and nut, that attach the tubes to the brackets and to each other. Torque the clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(g) Torque the lower tube nut of the inboard tube to the larger solenoid adapter to 225 - 250 lb-in. (25.422 - 28.246 N.m). Torque all of the remaining tube nuts to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety all the tube nuts.

(7) Install the fuel distribution valve supply tube (FM09) as follows. See Figure 413 (Sheet 8).

(a) Remove the protective covers.

R (b) Install the two packings PN 227433, lubricated
R with Engine Oil P03-001 or Sealing Ring Lubricant
R P06-053 and retainers PN 354120.

(c) Install the tube to fuel flowmeter and to the fuel metering unit. Tighten by hand.

(d) Install the clamp bolt, lubricated with Engine Oil P03-001, and attach the clamp to the HPC case bracket. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(e) Torque the tube nuts to 100 - 110 lb-in. (11.298 - 12.428 N.m). Loosen the tube nuts and torque them again to the same limits. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nuts.

(8) Install the hydraulic pressure manifold (CP05) and oil cooler inlet return manifold (CR01) as follows. See Figure 413 (Sheet 9).

(a) Remove the protective covers.

(b) Lubricate all the manifold coupling and tube nut threads with Antiseize Paste P06-054. Wipe off unwanted paste.

(c) Install the two manifolds to the two hoses at 3 o'clock position and to the manifolds at 5 o'clock position.

(d) Install the clamp bolts, lubricated with Engine Oil P03-001, and nut, that attach the manifolds to the engine brackets. Torque the clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(e) Torque the return manifold nuts (smaller) at each end to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nuts.

(f) Torque the pressure manifold nuts (larger) at each end to 340 - 375 lb-in. (38.415 - 42.369 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nuts.

(9) Install the compressor stator cylinder hydraulic pressure and return tubes (CP12) and (CR03) as follows. See Figure 413 (Sheet 9).

(a) Remove the protective covers.

(b) Lubricate the tube nut threads of both tubes with Antiseize Paste P06-054. Wipe off unwanted paste.

(c) Install the two tubes to the manifold tees and the cylinder adapters.

(d) Install the two clamp bolts, lubricated with Engine Oil P03-001, that attach the tubes to the Flange E bracket. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(e) Torque the return tube nuts (smaller) to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nuts.

(f) Torque the pressure tube nuts (larger) to 225 - 250 lb-in. (25.422 - 28.246 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nuts.

CAUTION: MAKE SURE YOU CONNECT THE TUBES TO THE CORRECT CONNECTORS OR FAULT MESSAGES WILL BE GENERATED.

(10) Install the (IDG) air/oil cooler valve hydraulic pressure (CP13) and return (CR12) tubes to the IDG heat exchanger at 4 o'clock position as follows. See Figure 413 (Sheet 10).

(a) Remove the protective covers.

(b) Lubricate the (IDG) air/oil cooler valve hydraulic pressure and return tube nut threads with Antiseize Paste P06-054. Wipe off unwanted paste.

(c) Install the two tubes to the manifold tees and heat exchanger adapters.

1 Install the CR12 tube to the adapter that is furthest from the lower triangular pad on the exchanger. Install the CP13 tube to the adapter that is closest to the lower triangular pad on the exchanger. Connect tube nut to heat exchanger adapter.

(d) Torque the two return tube nuts and the one smaller pressure tube nut to 200 - 225 lb-in. (22.597 - 25.422 N.m). Torque the one pressure tube nut (larger) to the manifold tee to 340 - 375 lb-in. (38.415 - 42.369 N.m).

(e) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nuts.

(11) Install the airframe (IDG) cooler outlet oil tube (LS03) as follows. See Figure 413 (Sheet 10).

(a) Remove the protective covers.

R (b) Install a packing, lubricated with Engine Oil
R P03-001 or Sealing Ring Lubricant P06-053 to the
R packing groove at the flanged end of the tube.

(c) Lubricate the tube nut threads with Antiseize Paste P06-054. Wipe off unwanted paste.

(d) Install the tube with the three bolts, lubricated with Engine Oil P03-001 to the heat exchanger. Tighten the tube nut by hand. Torque the three bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m). Torque the tube nut to 675 - 750 lb-in. (76.265 - 84.739 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut and bolts.

(12) Connect the angle gearbox oil pressure tube (LP09) to the angle gearbox at 6 o'clock position as follows. See Figure 413 (Sheet 11).

(a) Apply Antiseize Paste P06-054 to the threads of the mating tube adapter on the angle gearbox. Wipe off unwanted paste.

(b) Tighten and torque the tube nut to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

(13) Connect the angle gearbox oil scavenge tube (LR01) to the angle gearbox at 6 o'clock position as follows.

(a) Remove protective covers. Install the new packing, lubricated with Engine Oil P03-001, to the groove at the flanged end.

(b) Engage the flanged end into the angle gearbox boss. Install the two bolts, lubricated with Engine Oil P03-001. Tighten and torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(c) Install and torque all the clamp bolts that attach the tube to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(14) Install the 2.5 bleed valve cylinder hydraulic pressure (CP06) and return (CR02) tubes at 7 o'clock position as follows. See Figure 414 (Sheet 1).

(a) Remove protective covers.

(b) Apply Engine Oil P03-001 to the bleed valve cylinder return tube nut threads (smaller diameter tube).

(c) Install the tube. Tighten and torque the tube nuts to 270 - 300 lb-in. (30.506 - 33.895 N.m).

(d) Apply Antiseize Paste P06-054 to the bleed valve cylinder hydraulic pressure tube nut threads (largest diameter tube). Wipe off unwanted paste.

(e) Install the tube. Torque the tube nut attached to the manifold tee to 340 - 375 lb-in. (38.415 - 42.369 N.m). Torque the tube nut attached to the actuator to 225 - 250 lb-in. (25.422 - 28.246 N.m).

(f) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nuts.

(15) Connect the No. 1, 1.5, and 2 bearing oil scavenge tube (LR02) at the 7:30 o'clock position as follows. See Figure 414 (Sheet 2).

(a) Apply Engine Oil P03-001 to the tubes mating coupling threads.

(b) Tighten and torque the tube nut to 1300 - 1400 lb-in. (146.880 - 158.179 N.m).

(c) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

(16) Install the (left) air/oil cooler hydraulic pressure (CP07) and return (CR05) tubes as follows. See Figure 414 (Sheet 2).

(a) Remove the protective covers.

(b) Lubricate the tube nut threads of both tubes with Antiseize Paste P06-054. Wipe off unwanted paste.

(c) Install the tubes to the heat exchanger adapters and the manifold tees. Install the clamp bolt, lubricated with Engine Oil P03-001, that attaches the pressure tube to the Flange E bracket. Torque the clamp bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(d) Torque the one (larger) hydraulic pressure tube nut to the manifold tee to 225 - 250 lb-in. (25.422 - 28.246 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

(e) Torque the three remaining (smaller) tube nuts to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nuts.

CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTION USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF THE TUBE OR AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE EXTERNAL WIRE BRAID AND IN THE INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(17) Install the (left) air/oil cooler outlet oil hose and tube assembly (LP03) as follows. See Figure 414 (Sheet 3).

(a) Remove the protective covers.

(b) Apply wet Zinc Chromate Primer P18-003 to the mating surface of the flange end. Do not apply any primer to the raised portion near the packing groove. Let it air dry for 10 minutes before assembly.

R (c) Install a new packing, lubricated with Engine Oil
R P03-001 or Sealing Ring Lubricant P06-053 to the
R packing groove at the flanged end.

R (d) Install a new packing, lubricated with Engine Oil
R P03-001 or Sealing Ring Lubricant P06-053 and
R retainer to the nut end of the tube.

(e) Lubricate the tube nut threads with Antigalling Compound P06-021 and install the tube to the fuel/oil cooler bypass valve and the air/oil heat exchanger.

(f) Attach the flanged end with the two inboard bolts, lubricated with Engine Oil P03-001. Tighten by hand.

(g) Install the clamp bolt, lubricated with Engine Oil P03-001, that attaches the tube to the HPC case bracket. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(h) Torque the tube nut to 200 - 220 lb-in. (22.597 - 24.857 N.m). Loosen the tube nut and torque it again to the same limit. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

NOTE: Torque the bolts at the forward end with the installation of the oil inlet tube.

(18) Install the (left) air/oil cooler inlet oil tube (LP02) as follows. See Figure 414 (Sheet 3).

(a) Remove the protective covers.

R (b) Install the two new packings, lubricated with
R Engine Oil P03-001 or Sealing Ring Lubricant
R P06-053 to the tube ends.

(c) Install the tube to the heat exchanger and the main oil filter housing. Install the six bolts, lubricated with Engine Oil P03-001, that attach the tube.

(d) Install the bolt, lubricated with Engine Oil P03-001, and attaches the harness bracket to the tube. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(e) Torque the eight bolts that attach the two tube flanges to the heat exchanger and the one tube flange to the main oil filter housing to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(19) Install the main bearing oil pressure tube (LP05) to the last-chance strainer housing at 9 o'clock position as follows. See Figure 414 (Sheet 4).

(a) Remove the protective cover.

R R R (b) Install a new packing, lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 and retainer to the tube.

(c) Lubricate the tube nut threads with Antiseize Paste P06-054. Wipe off unwanted paste.

(d) Install the tube to the strainer housing adjacent to Flange E and above the fuel/oil cooler.

(e) Install the two clamp bolts, lubricated with Engine Oil P03-001, that attach the tube and the strainer housing to Flange E. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(f) Torque the forward tube nut to 675 - 750 lb-in (76.265 - 84.739 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

(g) Torque the rear tube nut to 140 - 160 lb-in. (15.818 - 18.078 N.m). Loosen the tube nut and torque it again to the same limits. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

(20) Connect the HPC air valve and air shutoff valve supply (AA22) and the signal tubes (AA06) and (AA18) to the solenoid at 10 o'clock position as follows. See Figure 414 (Sheet 4).

(a) Apply Antiseize Paste P06-054 to the adapter threads on the solenoid. Wipe off unwanted paste.

(b) Tighten and torque the (largest diameter) supply tube nut to 225 - 250 lb-in. (25.422 - 28.246 N.m).

(c) Tighten and torque the two (smaller diameter) signal tubes to 200 - 225 lb-in. (22.597 - 25.422 N.m).

(d) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nuts.

(21) Connect the main bearing breather tube (LB06) at 11:30 o'clock position as follows. See Figure 414 (Sheet 5).

(a) Apply Antiseize Paste P06-054 to the upper tube coupling threads. Wipe off unwanted paste.

(b) Tighten and torque the tube nut to 1150 - 1300 lb-in. (129.933 - 146.880 N.m).

(c) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

(22) Connect the EEC PT4.95 tube (AS04) at 11:30 o'clock position as follows. See Figure 414 (Sheet 5).

(a) Do not lubricate tube threads.

(b) Tighten and torque the tube nut to 270 - 300 lb-in. (30.506 - 33.895 N.m).

(c) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

E. Connect The Wiring Harnesses

CAUTION: SEE 72-00-00, INSTALLATION-00 (Task 72-00-00-990-008) AND (TASK 72-00-00-990-009) FOR NECESSARY GENERAL INSTALLATION INSTRUCTIONS ABOUT THE WIRING HARNESSES, LEADS, AND CABLES.

CAUTION: DO NOT TWIST OR BEND THE HARNESSES BADLY DURING INSTALLATION OR DAMAGE TO THE HARNESSES CAN RESULT.

(1) If removed, install the W3, W4, and W5 harnesses to the core-unit as follows. See Figure 415.

(a) Install the harness support bracket (upper) to the bracket on the fuel/oil cooler and the HPC case bracket. Attach the support bracket with the bolt and nut, lubricated with Engine Oil P03-001. Torque the bolt and nut to 36 - 40 lb-in. (4.067 - 4.519 N.m).

R
R

(b) Connect all the W3, W4, and W5 harness connectors (given below) to the mating harness receptacles as follows. For each connector:

1 Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary,
R carefully make straight all the bent pins. If
R necessary, clean the connector and receptacle
R by SPOP 6 (Task 70−21−00−110−900). Refer to
R Section 70−21−00 in the Standard Practices
R Manual, PN 585005.

2 Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

3 Use the Glenair TG−70 Strap Wrench or the Glenair TG−69 Soft−Jawed Pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- The connector coupling nut is fully tight
- The connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque. See the instructions given with the strap wrench for correct use.

4 Attach the W4J25 connector, the W5J26 connector, and the W3J24 connector to the HPC case brackets. Install the connector retaining brackets and bolts, lubricated with Engine Oil P03-001. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

5 Connect the W4P16 connector to the TCC air valve actuator.

6 Connect the W5P7 connector and the W4P3 connector to the stator vane actuator.

7 Install the clamp bolts, lubricated with Engine Oil P03-001, and nuts that attach the W3, W4, and W5 harnesses to the engine brackets. See Figure 415. Torque the clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(2) Install the W2 harness to the core-unit as follows. See Figure 416

(a) Remove the lockwire that attaches the W2 harness to the 12 o'clock strut. Adjust the harness in position.

(b) Connect the W2P26 harness connector to the harness receptacle on the HPC case bracket at 12 o'clock position as follows.

1 Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary,
R carefully make straight all the bent pins. If
R necessary, clean the connector and receptacle
R by SPOP 6 (Task 70-21-00-110-900). Refer to
R Section 70-21-00 in the Standard Practices
R Manual, PN 585005.

2 Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

3 Use the Glenair TG-70 Strap Wrench or the Glenair TG-69 Soft-Jawed Pliers and tighten the connector coupling nut. Use sufficient force to be sure:

- The connector coupling nut is fully tight
- The connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque. See the instructions given with the strap wrench for correct use.

(c) Attach the W2J9 harness receptacle to the HPC case bracket at 12 o'clock position. Install the retaining bracket and the two bolts, lubricated with Engine Oil P03-001. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(d) Install the clamp bolts, lubricated with Engine Oil P03-001, and nuts that attach the W2 harness to the Flange E bracket and the No. 1, 1.5 and 2 bearing breather tube. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(3) Install the W1 harness to the core engine as follows. See Figure 416.

(a) Remove the lockwire that attaches the W1 harness to the 12 o'clock strut. Adjust the harness in position.

(b) Connect the W1 harness connectors (given below) to the mating harness receptacles as follows. For each connector:

1 Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary,
R carefully make straight all the bent pins. If
R necessary, clean the connector and receptacle
R by SPOP 6 (Task 70−21−00−110−900). Refer to
R Section 70−21−00 in the Standard Practices
R Manual, PN 585005.

2 Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

3 Use the Glenair TG−70 Strap Wrench or the Glenair TG−69 Soft−Jawed Pliers and tighten the connector coupling nut. Use sufficient force to be sure:

- The connector coupling nut is fully tight
- The connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque. See the instructions given with the strap wrench for correct use.

- Connect the W1P25 harness connector to the receptacle on the HPC case bracket at 1 o'clock position and tighten.
- Connect the W1P11 and W1P10 harness

connectors to the 1 o'clock position solenoid and tighten. Install the clamp bolts, lubricated with Engine Oil P03-001, and nuts that attach the W1 harness to the solenoid muscle tube and the Flange E bracket. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

- Connect the W1P24 harness connector to the receptacle on the HPC case bracket at 10 o'clock position and tighten.
- Connect the W1P9 harness connector to the receptacle on the HPC case bracket at 12 o'clock position and tighten.
- Connect the W1P12 harness connector to the solenoid at 10 o'clock position and tighten.

(c) Install the clamp bolts, threads lubricated with Engine Oil P03-001, and nuts that attach the W1 harness to the HPC case brackets. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(4) Install the other harnesses as follows. See Figure 417.

(a) Attach the (IDG)-heat-exchanger harness receptacle to the HPC case bracket at 4 o'clock position. Install the retaining plate and the two bolts, lubricated with Engine Oil P03-001. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m). Install the clamp bolts, lubricated with Engine Oil P03-001, and nuts that attach the harness to the hydraulic tube. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(b) Attach the (engine)-air/oil-heat-exchanger-harness receptacle to the HPC case bracket at 7:30 o'clock position. Install the retaining plate and the two bolts, lubricated with Engine Oil P03-001. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(c) Connect the harness connectors (given below) to the harness receptacles as follows. For each connector:

1 Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary,
R carefully make straight all the bent pins. If
R necessary, clean the connector and receptacle
R by SPOP 6 (Task 70−21−00−110−900). Refer to
R Section 70−21−00 in the Standard Practices
R Manual, PN 585005.

2 Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

3 Use the Glenair TG−70 Strap Wrench or the Glenair TG−69 Soft−Jawed Pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- The connector coupling nut is fully tight
- The connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

- Connect the W4P4 and W5P11 harness connectors to the solenoid at 5 o'clock position and tighten. Install the clamp bolt, lubricated with Engine Oil P03-001, and nut that attach the W4 harness to the bleed-valve-supply-tube. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

- Connect the W3P15 harness connector to the 2.5 bleed valve actuator at 7 o'clock position and tighten.
- Connect the W3P17 harness connector to the receptacle on the HPC case bracket at 7:30 o'clock position and tighten.

F. Postrequisites

(1) If the variable stator vane control system was removed or disturbed, rig the system. See 72-00-00, Special Procedures-05 (Task 72-00-00-830-003-A00) or (Task 72-00-00-830-003-B00).

(2) If the turbine case cooling (TCC) air valve actuator was removed or disturbed, rig the actuator. See 72-00-00, Special Procedures-06 (Task 72-00-00-830-004).

(3) Refer to Table 401 for the installation procedures that are postrequisite to this procedure.

Step	Install The	Chapter/ Section	Installation
1	LPC/LPT Coupling Coupling	72-00-32	01 (Task 72-00-32 -420-001)
2	Compressor Inlet Cone	72-00-31	02 (Task 72-00-31-420-001)

ENGINE GENERAL - INTERMEDIATE CASE - INSTALLATION-22

Task 72-00-34-440-001:

1. Install The No. 1 Bearing Vibration Transducer

A. Equipment And Materials Required

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307
PN MS24256A16 Insertion Tool
Daniels Manufacturing Co. Tool HT210-16 or Equivanlent

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-288	Lockwire (AS3214-01)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	77-32-00/01/050
Packing	1	77-32-00/01/070
TGL Silicone Tape	AR	77-32-00/01/105

B. Procedure
See Figure 401, See Figure 402, and Figure 403.

CAUTION: BE SURE TO USE THE CORRECT PART NUMBERS. INTERCHANGEABILITY IS AFFECTED. REFER TO SB PW4ENG 77-13.

(1) Remove the covers that protect the holes in the intermediate case.

(2) Install the transducer in the conduits as follows.

(a) Apply Engine Oil P03-001 to one packing. Install the packing near the flange of the transducer.

(b) Hold the three pins on the end of the transducer cable together. Wind a piece of plastic sheet around the pins. Safety the plastic sheet with tape.

NOTE: The plastic and tape around the sockets and wire are used so that the cable will not get caught in the conduit when you install it. The cable must be able to move easily through the conduit with the plastic and tape wound around it. The plastic sheet on the wires and pins must also be sufficient to prevent their contamination by the tape.

(c) Apply Engine Oil P03−001 to one packing. Install the packing on the end of the front conduit.

(d) Put the cable end of the transducer into the front conduit, at the flange end of the conduit. Be sure the arrow on the transducer points up. Push the flanges together.

(e) Put the cable end of the transducer into the rear conduit (installed in the intermediate case). Push the cable through the conduit until both conduits are engaged. Be sure the arrow on the forward face of the transducer points toward the centerline of the engine.

(f) Pull the end of the cable through the hole at the rear of the intermediate case.

NOTE: The end of the cable must be inboard of the bracket that attaches the high pressure compressor bleed valve assembly to the intermediate case.

(3) Attach the connector to the bracket as follows.

CAUTION: DO NOT CAUSE DAMAGE TO THE PINS WHEN YOU REMOVE THE TAPE AND PLASTIC

(a) Remove the tape and plastic sheet from the end of the transducer cable.

(b) Install the connector in the bracket. The keyway must be aligned in the bracket as shown in Figure 403.

(c) Attach the connector to the bracket with four screws, lubricated with Engine Oil P03−001. Torque the screws to 4.5 − 6.0 lb−in. (0.508 − 0.678 N.m). Safety the screws with the Lockwire P05−288.

(4) Attach the cable to the connector as follows.

(a) Loosen the screws in the backshell clamp. Install the backshell on the cable but keep it out of the way.

NOTE: Do not tighten the clamp screws at this time.

(b) (Pre SB PW4ENG 77−14) Wrap the end of the cable three times with TGL silicone tape.

(c) Install the wires of the transducer in the connector as follows. Push the pins into the connector with MS24256A16 Insertion Tool until the pin touches the end of the hole.

1 The blue wire goes to No. 1 on the connector.

2 The white wire goes to No. 2 on the connector.

3 The green wire goes to No. 3 on the connector.

(d) Install the backshell on the connector. Torque the coupling ring of the connector to 50 − 55 lb−in. (5.649 − 6.214 N.m).

(e) (Pre SB PW4ENG 77−13) Loosely attach the bracket to the start/stability−bleed−valve−solenoid bracket with two bolts, lubricated with Engine Oil P03−001, and nuts.

(f) (Post SB PW4ENG 77−13) Loosely install the bracket on the gearbox driveshaft housing with two bolts.

(g) Put the clamps of the backshell over the center of the transducer cable ferrule.

(h) (Pre SB PW4ENG 77−14) Install four spacers, one between each screw hole of the clamp and the backshell. Install lock washers under the heads of the screws.

(i) (Post SB PW4ENG 77−14) Attach the backshell to the cable with the clamp and screws, washers under the heads of the screws.

(j) (Reference 1014) With the cable ferrule positioned under the backshell clamps, tighten the backshell clamp screws until the backshell clamps fits finger tight onto ferrule but still allow relative movement.

(k) (Reference 1014) Perform a contact retention test on all 3 pins in the connector. Push test each pin individually using HT210−16 Daniels Mfg. Co. Tool or equivalent. If any of the pins are forced back into the connector, disassemble the cable assembly as necessary to correct the installation of the pin(s). Do not attempt to pull the pins back out into the connector with needle nose pliers. This will cause damage to the pins.

(l) (Reference 1014) Tighten the clamp screws and backshell firmly to secure the cable. Torque the two clamp screws to 4.5 − 6.0 lb−in. (0.508 − 0.678 N.m).

(m) (Post SB PW4ENG 77−14) Safety the backshell and clamp screws with the Lockwire P05−288. Put the wire through the head of one of the screws, then through the backshell, then through the head of the other screw.

(n) (Reference 1014) Check the continuity of the cable assembly as follows:

1 Contact No. 1 to ground should read infinity.

2 Contact No. 2 to ground should read infinity.

3 Contact No. 3 to ground should read zero.

4 If requirements are not met, perform ohmmeter setting again and repeat above continuity checks.

5 If requirements are still not met, disassemble and reassemble the cable as necessary to check the installation as above. Repeat steps (j) through (n) above.

(5) (Pre SB PW4ENG 77−13) Torque the bolts that attach the transducer to the bracket to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(6) (Post SB PW4ENG 77−13) Torque the bolts that attach the bracket to the gearbox driveshaft housing to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(7) (Post SB PW4ENG 77−17) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the (LP09) tube nut to the transducer bracket mounted on gearbox driveshaft housing assembly.

(8) (Post SB PW4ENG 77−13) Attach the cable to the bracket on the N1 speed transducer with a clamp and clamp bolt, lubricated with Engine Oil P03−001. Torque the clamp bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

NOTE: For aircraft that are not electrically equipped with the transducer, but the engines are equipped with the transducer, install an electrical cap to the connector. Tighten the cap by hand and install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the cap. This cap must cover the connector during engine use if the aircraft harness does not connect to the transducer receptacle (Post SB PW4ENG 77−11).

ENGINE GENERAL - INTERMEDIATE CASE - INSTALLATION-23

Task 72-00-34-450-019:

1. Install EEC Wiring Harness - W5 (Core Engine)

A. General

(1) To install the EEC wiring harness - W3, see 72-00-34, Installation-18 (Task 72-00-34-450-017).

(2) To install the EEC wiring harness - W4, see 72-00-34, Installation-19 (Task 72-00-34-450-018).

B. Equipment And Materials Required

Standard Tools:

Glenair TG-70	Strap Wrench or
Glenair TG-69	Soft Jawed Pliers

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P11-009	Alcohol, Denatured Ethyl (AMS 3002)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Tape - Lacing And Tying, PN 1B1773		
Lockwire, AS3214-01		

C. Procedure

See Figure 401, Figure 402, Figure 403, Figure 404, Figure 405, Figure 406, Figure 407, Figure 408, Figure 409, Figure 410, Figure 411, Figure 412, Figure 413, Figure 414, Figure 415, Figure 416, Figure 417, Figure 418, Figure 419 and, Figure 420.

CAUTION: SEE 72-00-00, INSTALLATION-00 FOR THE GENERAL INSTALLATION REQUIREMENTS FOR THE ELECTRICAL HARNESSES, LEADS AND CABLES.

CAUTION: DO NOT TWIST OR BEND THE HARNESS BADLY DURING THE INSTALLATION, OR DAMAGE TO THE HARNESS CAN OCCUR.

(1) Install the W5 harness on the left and right side of the engine as follows.

(a) Remove the protective closure. Install the W5J26 connector flange to the HPC case bracket located at the 11:30 o'clock position. Attach the connector flange to the bracket temporarily with lockwire. Install the protective closure. See Figure 403.

(b) Place the leg of the harness with the connectors W5P1, W5P7, W5P8, W5P11, and W5J12 (and W5J13 for engines equipped with 2.95 bleed valve thermocouples) over the top of the HPC case and down the right side of the engine.

(c) Remove the lockwire securing the W5J26 connector flange to the HPC case bracket. Install the harness bracket (cut−out up) to attach the connector flange between the two brackets. Align the bolt holes and install the bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(2) (Pre SB PW4ENG 73−163) Remove the protective closures. Install the W5J12 connector flange to the Flange K bracket at the 3:30 o'clock position. Install the harness bracket (angle forward with cut−out inboard) to attach the connector flange between the two brackets. Align the bolt holes and install the bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Figure 415.

(3) (Post SB PW4ENG 73−163) See Figure 415.

(a) Remove the protective closures. Align the W5J12 connector to the TCA tube flange bracket. Position the connector in the bracket so that the master keyway is located at an outboard location at approximately 30 degrees above the horizontal center line. Secure the connector to the TCA tube flange bracket with a loop clamp bracket and three (3) bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(b) Position the W5 harness immediately forward of the W5J12 connector to the TRC bracket. Secure the harness to the TRC bracket with a loop clamp bracket and bolt, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) (Post SB PW4ENG−73−192) Install cooling shields around W5 harness connector as follows:

NOTE: Pre SB PW4ENG 73−192 engines do not have W5/W6 wiring harness connector cooling.

1 Position the cooling shields around the W5 harness connector W5J12 and slide the cooling shield tabs into loop clamp bracket. Make sure the shield with the hose fitting is on the bottom.

2 Install the clamps around the cooling shields. Torque the hose clamps to 10 − 15 lb−in. (1.130 − 1.695 N.m).

3 Install the cooling hose and clamp onto the bottom cooling shield fitting. Torque the hose clamps to 10 − 15 lb−in. (1.130 − 1.695 N.m).

(d) If removed or loosened, install the clamp and bolt attaching the wiring harness to the loop clamp bracket. Lubricate bolt threads with Engine Oil P03−001. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(4) For engines equipped with 2.95 bleed valve thermocouples only: Install the W5J13 connector flange to the bracket on the main gearbox. Install the harness bracket (cutout inboard) to attach the connector flange between the two brackets. Align the bolt holes and install the bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Figure 415.

(5) (Pre SB PW4ENG 72−572 or SB PW4ENG 75−106 or SB PW4ENG 72−756) Connect the W5P10 harness connector to the HPC secondary flow control valve located at the 9:30 o'clock position as follows. See Figure 402 (Sheet 1 or 2).

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

CAUTION: USE THE CORRECT ASSEMBLY TORQUE. USE OF THE WRONG ASSEMBLY TORQUES CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTENING PROTECTION.

(b) (Reference 2154) Tighten and torque the connector to 21 − 26 lb−in. (2.373 − 2.938 N.m). Lockwire the connector nut with AS3214−01 Lockwire.

NOTE: SB PW4ENG 72−572 or SB PW4ENG 75−106 or SB PW4ENG 72−756 removes connector W5P10 from the W5 wiring harness. See Figure 402 (Sheet 3).

(6) Connect the W5 harness connectors (given below) to the mating harness receptacles as follows. See Figure 402 and Figure 411. For each connector:

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND

CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 strap wrench or the Glenair TG−69 soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:

− the connector coupling nut is fully tight
− the connector fits tightly against the receptacle (metal to metal).

This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

Connector	Component	Location
W5P8	EEC Fuel Temperature Thermocouple	Fuel Pump Housing 4:30 O'clock
W5P1	Fuel Metering Unit (Rear Connector)	Front Of Fuel Pump 5 O'clock
W5P11	Ninth Stage Start/Stability (2.9) Bleed Valve Solenoid (Inboard Connector)	Intermediate Case 5 O'clock
W5P7	Variable Stator Vane Actuator (Top Connector)	4 O'clock
W5P6	EEC Alternator (Lower Connector)	Bottom Of Gearbox 7 O'clock
W5P5	Fuel/Oil Cooler Bypass Valve Solenoid (Rear Connector)	8 O'clock
W2P26	Harness Connector To W5J26 Harness Connector	11:30 O'clock

(CONTINUED)

Connector	Component	Location
W6P12	Harness Connector To W5J12 Harness Connector	3:30 O'clock

(7) (Pre SB PW4ENG 73−84) Connect the W5P8 connector of the harness to the EEC fuel temperature thermocouple probe as follows.

(8) (Post SB PW4ENG 73−84) For a thermocouple probe with a studded terminal type receptacle and for engines equipped with 2.95 bleed valve thermocouple install the wiring harness as follows.

(a) Install the wiring harness terminals to the thermocouple studs and install loosely the nuts to the thermocouple studs.

(b) Install the clamp, ground strap, and bolt loosely to the bracket on the housing.

CAUTION: TO PREVENT DAMAGE TO THE WIRING HARNESS, MAKE SURE THE THERMOCOUPLE STUD BOX DOES NOT TURN WHEN THE COUPLING NUT IS TORQUED.

(c) If necessary to align the thermocouple stud box, remove the lockwire from the thermocouple coupling nut to the adapter and loosen the coupling nut.

(d) Align the thermocouple stud box with the wiring harness connector.

(e) (Reference 2167) Hold the thermocouple stud box and torque the thermocouple probe coupling nut to 95 − 100 lb−in. (10.734 − 11.298 N.m). Do not let the thermocouple studs turn.

CAUTION: DO NOT ALIGN THE THERMOCOUPLE STUD BOX AFTER THE COUPLING NUT IS TORQUED. HOLD THE THERMOCOUPLE STUD BOX AND LOOSEN THE COUPLING NUT AND ALIGN THE THERMOCOUPLE STUD BOX AGAIN.

(f) Make sure the thermocouple stud box is aligned. Do not put too much force on the terminals of the wiring harness.

CAUTION: TOO MUCH TORQUE (MORE THAN MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(g) (Reference 2273) Torque the alumel nuts (larger terminal studs) to 18 - 22 lb-in. (2.034 - 2.486 N.m).

(h) (Reference 2273) Torque the chromel nuts (smaller terminal studs) to 15 - 18 lb-in. (1.695 - 2.034 N.m).

(i) Install lockwire from the coupling nut to the adapter.

(j) Torque the bolt that attaches the clamp and ground strap to the bracket on the housing to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(9) For engines equipped with 2.95 bleed valve thermocouples only: Connect the thermocouple wires (leads) on the W5 harness to the thermocouple studs on the 2.9 bleed valve as follows:

(a) Remove the nuts from the thermocouple studs and attach the thermocouple wires (lead) with the nuts (round collar and inboard). Align the leads so that the wires are parallel to each other.

CAUTION: TOO MUCH TORQUE (MORE THAN THE MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(b) (Reference 2273) Torque the alumel nuts (larger terminal studs) to 18 - 22 lb-in. (2.034 - 2.486 N.m).

(c) (Reference 2273) Torque the chromel nuts (smaller terminal studs) to 15 - 18 lb-in. (1.695 - 2.034 N.m).

(10) Adjust the W5 harness for any necessary clearances as required. Install the clamps at all clamp points. Refer to the figures. Attach the clamps loosely to the engine with bolts and/or nuts, threads lubricated with Engine Oil P03−001.

NOTE: Use different clamp sizes on the harnesses to prevent harness movement when tightened. See the Illustrated Parts Catalog for selection of the clamp sizes and part numbers.

(11) Make sure that the harnesses are not tight to the point where sharp bends are caused, and that the harnesses do not touch any engine parts or plumbing. Provide a drip loop on the leads where the wires run downward into the connector.

(12) Tighten all the previously installed clamp nuts and/or bolts to a torque of 36 − 40 lb−in. (4.067 − 4.519 N.m).

(13) Tie the harnesses as shown in Figures 409 and 419.

NOTE: Ties must be made with a clove hitch with an extra loop, followed by a square knot, as shown in Figure 409 and 419. The clove hitch and square knot must be tightened satisfactorily in place. The harnesses must not be stressed or damaged by overtightening the ties. Where the harness bundles are more than 1.500 inches (38.100 mm) in diameter, the lacing tape must be doubled. Cut the ends of the lacing tape to a length of 0.250 − 0.500 inch (6.350 − 12.700 mm).

ENGINE GENERAL - INTERMEDIATE CASE - INSTALLATION-23

Task 72-00-34-450-023:

1. Install EEC Wiring Harness - W5 (Core Engine)

A. General

(1) To install the EEC wiring harness - W3, see 72-00-34, Installation-18 (Task 72-00-34-450-017).

(2) To install the EEC wiring harness - W4, see 72-00-34, Installation-19 (Task 72-00-34-450-018).

B. Equipment And Materials Required

Standard Tools:
Glenair TG-70 Strap Wrench or
Glenair TG-69 Soft Jawed Pliers

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P11-009	Alcohol, Denatured Ethyl (AMS 3002)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Tape - Lacing And Tying, PN 1B1773		
Lockwire, AS3214-01		

C. Procedure
See Figure 401, Figure 402, Figure 403, Figure 404, Figure 405, Figure 406, Figure 407, Figure 408, Figure 409, Figure 410, Figure 411, Figure 412, Figure 413, Figure 414, Figure 415, Figure 416, Figure 417, Figure 418, Figure 419 and Figure 420.

CAUTION: SEE 72-00-00, INSTALLATION-00 FOR THE GENERAL INSTALLATION REQUIREMENTS FOR THE ELECTRICAL HARNESSES, LEADS AND CABLES.

CAUTION: DO NOT TWIST OR BEND THE HARNESS BADLY DURING THE INSTALLATION, OR DAMAGE TO THE HARNESS CAN OCCUR.

(1) Install the W5 harness on the left and right side of the engine as follows.

(a) Remove the protective closure. Install the W5J26 connector flange to the HPC case bracket located at the 11:30 o'clock position. Attach the connector flange to the bracket temporarily with lockwire. Install the protective closure. See Figure 403.

(b) Place the leg of the harness with the connectors W5P1, W5P7, W5P8, W5P11, and W5J12 (and W5J13 for engines equipped with 2.95 bleed valve thermocouples) over the top of the HPC case and down the right side of the engine.

(c) Remove the lockwire securing the W5J26 connector flange to the HPC case bracket. Install the harness bracket (cut−out up) to attach the connector flange between the two brackets. Align the bolt holes and install the bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(2) (Pre SB PW4ENG 73−163) Remove the protective closures. Install the W5J12 connector flange to the Flange K bracket at the 3:30 o'clock position. Install the harness bracket (angle forward with cut−out inboard) to attach the connector flange between the two brackets. Align the bolt holes and install the bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Figure 415.

(3) (Post SB PW4ENG 73−163) See Figure 415.

(a) Remove the protective closures. Align the W5J12 connector to the TCA tube flange bracket. Position the connector in the bracket so that the master keyway is located at an outboard location at approximately 30 degrees above the horizontal center line. Secure the connector to the TCA tube flange bracket with a loop clamp bracket and three (3) bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(b) Position the W5 harness immediately forward of the W5J12 connector to the cover bracket. Secure the harness to the cover bracket with a loop clamp bracket and bolt, threads lubricated with Engine Oil P03−001. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) (Post SB PW4ENG 73−192) Install cooling shields around W6 harness connector as follows:

NOTE: Pre SB PW4ENG 73−192 engines do not have W5/W6 wiring harness connector cooling.

1 Position the cooling shields around the W5 harness connector W5J12 and slide the cooling shield tabs into loop clamp bracket. Make sure the shield with the hose fitting is on the bottom.

2 Install the clamps around the cooling shields. Torque the hose clamps to 10 − 15 lb−in. (1.130 − 1.695 N.m).

3 Install the cooling hose and clamp onto the bottom cooling shield fitting. Torque the hose clamps to 10 − 15 lb−in. (1.130 − 1.695 N.m).

(d) If removed or loosened, install the clamp and bolt attaching the wiring harness to the loop clamp bracket. Lubricate bolt threads with Engine Oil P03−001. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(4) For engines equipped with 2.95 bleed valve thermocouples only: Install the W5J13 connector flange to the bracket on the main gearbox. Install the harness bracket (cutout inboard) to attach the connector flange between the two brackets. Align the bolt holes and install the bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Figure 415.

(5) Connect the W5 harness connectors (given below) to the mating harness receptacles as follows. See Figure 402 and Figure 411. For each connector:

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 strap wrench or the Glenair TG−69 soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight.
- the connector fits tightly against the receptacle (metal to metal).

This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

Connector	Component	Location
W5P8	EEC Fuel Temperature Thermocouple	Fuel Pump Housing 4:30 O'Clock
W5P1	Fuel Metering Unit (Rear Connector)	Front Of Fuel Pump 5 O'Clock

Connector	Component	Location
W5P11	Ninth Stage Start/Stability (2.9) Bleed Valve Solenoid (Inboard Connector)	Intermediate Case 5 O'Clock
W5P7	Variable Stator Vane Actuator (Top Connector)	4 O'Clock
W5P6	EEC Alternator (Lower Connector)	Bottom Of Gearbox 7 O'Clock
W5P5	Fuel/Oil Cooler Bypass Valve Solenoid (Rear Connector)	8 O'Clock
W2P26	Harness Connector To W5J26 Harness Connector	11:30 O'Clock
W6P12	Harness Connector To W5J12 Harness Connector	3:30 O'Clock

(6) For a thermocouple probe with a studded terminal type receptacle and for engines equipped with 2.95 bleed valve thermocouple install the wiring harness as follows.

(a) Install the wiring harness terminals to the thermocouple studs and install loosely the nuts to the thermocouple studs.

(b) Install the clamp, ground strap, and bolt loosely to the bracket on the housing.

CAUTION: TO PREVENT DAMAGE TO THE WIRING HARNESS, MAKE SURE THE THERMOCOUPLE STUD BOX DOES NOT TURN WHEN THE COUPLING NUT IS TORQUED.

(c) If necessary to align the thermocouple stud box, remove the lockwire from the thermocouple coupling nut to the adapter and loosen the coupling nut.

(d) Align the thermocouple stud box with the wiring harness connector.

(e) (Reference 2167) Hold the thermocouple stud box and torque the thermocouple probe coupling nut to 95 − 100 lb−in. (10.734 − 11.298 N.m). Do not let the thermocouple studs turn.

CAUTION: DO NOT ALIGN THE THERMOCOUPLE STUD BOX AFTER THE COUPLING NUT IS TORQUED. HOLD THE THERMOCOUPLE STUD BOX AND LOOSEN THE COUPLING NUT AND ALIGN THE THERMOCOUPLE STUD BOX AGAIN.

(f) Make sure the thermocouple stud box is aligned. Do not put too much force on the terminals of the wiring harness.

CAUTION: TOO MUCH TORQUE (MORE THAN MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(g) (Reference 2273) Torque the alumel nuts (larger terminal studs) to 18 − 22 lb−in. (2.034 − 2.486 N.m).

(h) (Reference 2273) Torque the chromel nuts (smaller terminal studs) to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(i) Install lockwire from the coupling nut to the adapter.

(j) Torque the bolt that attaches the clamp and ground strap to the bracket on the housing to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(7) For engines equipped with 2.95 bleed valve thermocouples only: Connect the thermocouple wires (leads) on the W5 harness to the thermocouple studs on the 2.9 bleed valve as follows:

(a) Remove the nuts from the thermocouple studs and attach the thermocouple wires (lead) with the nuts (round collar and inboard). Align the leads so that the wires are parallel to each other.

CAUTION: TOO MUCH TORQUE (MORE THAN THE MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(b) (Reference 2273) Torque the alumel nuts (larger terminal studs) to 18 − 22 lb−in. (2.034 − 2.486 N.m).

(c) (Reference 2273) Torque the chromel nuts (smaller terminal studs) to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(8) Adjust the W5 harness for any necessary clearances as required. Install the clamps at all clamp points. Refer to the figures. Attach the clamps loosely to the engine with bolts and/or nuts, threads lubricated with Engine Oil P03−001.

NOTE: Use different clamp sizes on the harnesses to prevent harness movement when tightened. See the Illustrated Parts Catalog for selection of the clamp sizes and part numbers.

(9) Make sure that the harnesses are not tight to the point where sharp bends are caused, and that the harnesses do not touch any engine parts or plumbing. Provide a drip loop on the leads where the wires run downward into the connector.

(10) Tighten all the previously installed clamp nuts and/or bolts to a torque of 36 − 40 lb−in. (4.067 − 4.519 N.m).

(11) Tie the harnesses as shown in Figures 409 and 419.

NOTE: Ties must be made with a clove hitch with an extra loop, followed by a square knot, as shown in Figures 409 and 419. The clove hitch and square knot must be tightened satisfactorily in place. The harnesses must not be stressed or damaged by overtightening the ties. Where the harness bundles are more than 1.500 inches (38.100 mm) in diameter, the lacing tape must be doubled. Cut the ends of the lacing tape to a length of 0.250 − 0.500 inch (6.350 − 12.700 mm).

Task 72-00-34-450-021:

1. Install Turbine Vane And Blade Cooling Air Valve, IDGS Air/Oil Heat Exchanger Valve Override Solenoid

A. Equipment And Materials Necessary

Standard Tools:

Glenair TG-70 Strap Wrench or
Glenair TG-69 Soft Jawed Pliers
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
R P06-054	Paste, Antiseize (PWA 36246)
P11-014	Alcohol, Isopropyl (PMC 9094)

B. Procedure

See Figure 401.

(1) If a new solenoid must be installed do the following:

(a) Remove the protection covers from all openings on the solenoid.

(b) Install the two adapters with gaskets, threads lubricated with Engine Oil P03-001, to the two openings on top of the solenoid. Torque the adapters to 65 - 75 lb-in. (7.344 - 8.474 N.m).

(c) Install a cap, threads lubricated with Engine Oil P03-001, to the right side adapter. Torque the cap to 90 - 100 lb-in. (10.169 - 11.298 N.m).

(d) Install two adapters, larger adapter in the center port and smaller adapter in the right side port on the rear of the solenoid with gaskets, threads lubricated with Engine Oil P03-001. Torque the larger adapter to 150 - 170 lb-in. (16.948 - 19.207 N.m) and the smaller adapter to 110 - 120 lb-in. (12.428 - 13.558 N.m).

(e) Install plug with a gasket, threads lubricated with Engine Oil P03−001, to the left port on the rear of the solenoid. Torque the plug to 110 − 120 lb−in. (12.428 − 13.558 N.m).

(2) Put the solenoid under the loop clamp bracket at approximately the 1 o'clock position on the intermediate case. Install the solenoid with the two tube adapters pointing rearward and the rear lugs of the solenoid rearward of the lugs on the case. Install the switch and bracket assembly to the solenoid and attach with four bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(3) Connect the bleed valve supply tube (AA25) to the solenoid as follows:

(a) Lubricate the threads of the adapter with
R Antiseize Paste P06−054. Wipe off unwanted paste.

(b) install the supply tube nut to the center adapter on the rear of the solenoid.

(c) Torque the tube nut to 225 − 250 lb−in. (25.422 − 28.246 N.m).

(4) Connect the HPC drum air valve signal tube (AA01) to the solenoid as follows:

(a) Lubricate the lower rear adapter on the solenoid
R with Antiseize Paste P06−054.

R (b) Wipe off unwanted paste.

(c) Install the air solenoid signal tube nut to the adapter.

(d) (Reference 2171) Torque the tube nut to 170 − 180 lb−in. (19.207 − 20.337 N.m)).

(e) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the tubes (AA01), (AA25), and plug.

(5) Install the pressure switch tube assembly as follows:

(a) Lubricate the threads at the elbow end of the tube with Engine Oil P03−001 and threads at the
R straight end of the tube with Antiseize Paste
R P06−054. Wipe off unwanted paste. Install the tube to the engine.

(b) Torque the elbow end to the solenoid adapter to 90 − 100 lb−in. (10.169 − 11.298 N.m). Torque the straight end to the pressure switch to 65 − 75 lb−in. (7.344 − 8.474 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to both ends of the tube and to the cap assembly.

(6) Connect the W1P10 and W1P11 harness connectors to the solenoid. See 70−10−00, Standard Practices Manual.

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Isopropyl Alcohol P11−014 and let air dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is hand tight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 strap wrench or the Glenair TG−69 soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to make sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).

- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

C. Postrequisites

(1) Install the fan exit liner segment (inner rear) that is at the 1 o'clock position. Refer to 72-00-33, Installation-16 Task 72-00-33-440-001.

(Task 72-00-34-450-021)

Task 72-00-34-450-022:

1. Install Turbine Vane Cooling Air Valve, Turbine Vane And Blade Cooling Air Valve Solenoid

A. Equipment And Materials Necessary

Standard Tools:
Glenair TG-70 Strap Wrench Or
Glenair TG-69 Soft Jawed Pliers
Bergen Mechanical Crimper (Optional) Model M303, M305 Or M307

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
	P05-292	Ferrule, Safety Cable (Optional)
R	P06-054	Paste, Antiseize (PWA 36246)
	P11-014	Alcohol, Isopropyl (PMC 9094)

B. Procedure

See Figure 401.

(1) If a new solenoid must be installed, do the following:

(a) Remove the protection covers from all openings on the solenoid.

(b) Install two adapters with gaskets, threads lubricated with Engine Oil P03-001, to the two openings on the top of the solenoid. Torque the adapters to 65 - 75 lb-in. (7.344 - 8.474 N.m).

(c) Install two caps, threads lubricated with Engine Oil P03-001, to the above adapters. Torque the caps to 90 - 100 lb-in. (10.169 - 11.298 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to the caps.

(d) Install three adapters, larger adapter in center, to three ports on the rear of the solenoid with gaskets, threads lubricated with Engine Oil P03−001. Torque the center adapter to 150 − 170 lb−in. (16.948 − 19.207 N.m) and the two outer adapters to 110 − 120 lb−in. (12.428 − 13.558 N.m).

(2) Position the solenoid to the intermediate case under the bracket, at approximately the 10 o'clock position, with the three adapters pointing rearward and rear lugs on the valve solenoid rearward of the lugs on case with four bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

NOTE: If the clamp bolt was loosened to gain clearance for solenoid removal, tighten and torque the clamp bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

R (3) Lubricate the threads of the adapter with antiseize
R Paste P06−054 and install the supply tube assembly to
R the center adapter on the rear of the solenoid. Wipe
R off excess paste. Torque the tube nut to 225 − 250
lb−in. (25.422 − 28.246 N.m).

(4) Lubricate the upper rear adapter on the valve solenoid with Engine Oil P03−001, and install the signal tube assembly to the adapter. Torque the tube nut to 270 − 300 lb−in. (30.506 − 33.895 N.m).

(5) Lubricate the lower rear adapter on the valve solenoid with Engine Oil P03−001, and install the signal tube assembly to the adapter. Torque the tube nut to 270 − 300 lb−in. (30.506 − 33.895 N.m).

(6) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the tube nuts.

(7) Connect the W3P12 harness connector to the solenoid receptacle as follows.

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Isopropyl Alcohol P11−009 and let air dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG-70 strap wrench or the Glenair TG-69 soft-jawed pliers and tighten the connector coupling nut. Use sufficient force to make sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

C. Postrequisites

(1) Install the fan exit liner segment (inner rear) that is at the 10 o'clock position. Refer to 72-00-33, Installation-16 (Task 72-00-33-440-001).

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72-00−34−990−001:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B or C located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.

C. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits

(1) Limits applicable to any combination of new or used parts.

(a) This column provides the acceptable (minimum − maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.

(b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.

(c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (13.131) (−) 0.512 (13.005) = .005 (0.126)

0.527 (13.385) (−) 0.508 (12.903) = .019 (0.482)

EXAMPLE 2

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3.These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

F. Fits And Clearances

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max

ENGINE GENERAL - INTERMEDIATE CASE - INSPECTION/CHECK-10

Task 72-00-34-990-010:

1. Intermediate Case Module Assembly Visual Inspection

A. Equipment And Materials Necessary - None

B. General

NOTE: All applicable Airworthiness Directives (AD's) must be complied with and these directives takes precedence over all inspections or repairs given in this module inspection.

(1) This inspection does not permit time since overhaul to be set to zero.

(2) These procedures give instructions for the visual inspection of the intermediate case module assembly after removal from the engine. Do these procedures before you do the preservation, packing or module installation procedure. This procedure is to find those easy to see types of damage, which can make it necessary to do more disassembly, inspection or repair. For the general visual inspection instructions, refer to Section 70-31-00 in the Standard Practices Manual, PN 585005.

(3) The inspection table in this section is applicable to the intermediate case modules with some, none or all of the components installed. You do not have to disassemble the module assembly to do this inspection. You can choose to apply individual limits to those areas that are visible at all stages of disassembly. If a condition shows that there can be damage that you cannot see, remove a component to fully examine the damaged area. Use the applicable procedures in this manual to remove the component and do an inspection by step (4).

(4) Remove all the components that you find not serviceable at the modular level. Send the applicable components for more inspection and repair at the component level maintenance. Refer to Section 72-34-00 in the PW4000 Series CIR, PN 51A357. Components that you remove from the intermediate case module, will need a Cleaning, Inspection and Repair Manual component level inspection/check.

(5) Unless given differently, non-toleranced areas given in this section are to corners, points of tangency between surfaces or at the points opposite to one of these locations.

C. Procedure

(1) Visually examine the case outer diameter area for surface damage and wear. See Table 801 and Figure 801.

(2) Visually examine the case inner diameter and gaspath area for surface damage and wear. See Table 802 and Figure 802.

(3) Visually examine the case rear surfaces, thrust clevises, front mount, fan exit case flange, HPC inlet guide vane mating surface and No. 2 bearing support mounting flange for damage and wear. See Table 803 and Figure 803.

(4) Visually examine the case rear cover and fairing for damage and wear. See Table 804 and Figure 804.

(5) Visually examine the visible areas of the strut fairings and fan exit liner assemblies for damage and wear. See Table 805 and Figure 805.

(a) Examine Indexes 1 thru 4 which are visible on the case. If the fan exit liners are installed, examine Index 5. If the fan exit liners are removed, continue the inspection with Indexes 6 thru 9 in this table.

(6) If installed, visually examine the stage 4 compressor stator assembly. See Table 806 and Figure 806.

NOTE: The limits given below are those which the stator assembly can continue-in-service. The limits are evaluated from the standpoint of structural integrity and gross performance deficiencies. More airfoil blends or discontinuities in the seal lands will cause a decrease of efficiency and performance. Refurbishment of all the damage is recommended to gain back the performance levels.

NOTE: All corrosion pitting inspection depth limits are applicable after the removal of the damage by the applicable repair.

R ENGINE GENERAL − INTERMEDIATE CASE − INSPECTION/CHECK−10

R NOTE: If the damage to the stator vanes are found,
R it is necessary to remove the stage 4 stator
R assembly to do Repair−07. Refer to Section
R 72−34−50 in the PW4000 Series CIR, PN 51A357.

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
1 Hole in the ground handling pads for damage and wear	0.003 inch (0.076 mm) depth maximum	Damage to a maximum of 0.062 inch (1.575 mm) at the 12:00 o'clock ground handling pad can be repaired. Damage at 3:00 and 9:00 o'clock locations more than the permitted limit and damage at 12:00 o'clock and more than 0.062 inch (1.575 mm) must be repaired	
2 Rivets that attach the struts for:			
Looseness and damage	Not permitted	Replace the rivets	Refer to Section 70-43-00 in the Standard Practices Manual, PN 585005.
Nicks, dents and surface damage	0.003 inch (0.076 mm) depth maximum	Replace the rivets	Refer to Section 70-43-00 in the Standard Practices Manual, PN 585005.

Outer Diameter Case Surface Visual Inspection
Table 801

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
3			
Surface of ground handling pads (at 3 and 9 o'clock positions only) for surface damage	0.020 inch (0.508 mm) maximum depth	0.050 inch (1.270 mm) depth maximum. 15 percent maximum of the full ground handling pad surface	Refer to Section 72-34-01, Repair-49 in the PW4000 Series CIR, PN 51A357.
4			
Timing pin for looseness and damage	Not permitted	Replace timing pin	Refer to Section 72-34-01, Repair-39, Repair-41 in the PW4000 Series CIR, PN 51A357.
5			
Fan exit case mount bolt holes and mating flange for:			
Wear and galling	0.300 inch (7.620 mm) diameter maximum	See the repair	Repair mount bolt holes. Refer to Section 72-34-01, Repair-38, Repair-41 in the PW4000 Series CIR, PN 51A357.

Outer Diameter Case Surface Visual Inspection
Table 801 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Cracks	Not permitted	See the repair	Repair cracks. Refer to Section 72-34-01, Repair-38, Repair-41 in the PW4000 Series CIR, PN 51A357.
6 Case outer surface for:			
Cracks originating below or in the area of the strut attach plates.	Not permitted		Remove from service
Bending and distortion	Not permitted	Distortion can be repaired to a maximum of 0.080 inch (2.032 mm) axially and 6.000 inches (152.400 mm) circumferentially	

NOTE: It is necessary to examine the case inner surfaces only if the liner assemblies are removed

Area A Rear lip:			
Surface damage	Not permitted	0.060 inch (1.524 mm) radial depth maximum, 0.120 inch (3.048 mm) axial width maximum and 2.000 inches (50.800 mm) circumferential	Refer to Section 72-34-01, Repair-49 in the PW4000 Series CIR, PN 51A357.

Outer Diameter Case Surface Visual Inspection
Table 801 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
(CONTINUED)		length maximum. Maximum of three locations for a part	
Area B Rear inner and outer walls: Surface damage and corrosion	0.003 inch (0.076 mm) depth maximum, if a minimum wall thickness in damaged area is kept	0.012 inch (0.305 mm) radial depth maximum and 6.000 inches (152.400 mm) circumferential length maximum with a 1.000 inch (25.400 mm) minimum separation Keep a minimum wall thickness of: 0.203 inch (5.156 mm) for fan case detail PN 50G470. 0.198 inch (5.029 mm) for fan case detail PN 52G068, 52G158. 0.178 inch (4.521 mm) for fan case detail PN 51G544. Or 0.037 inch (0.940 mm)	Refer to Section 72-34-01, Repair-49 in the PW4000 Series CIR, PN 51A357.

Outer Diameter Case Surface Visual Inspection
Table 801 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
(CONTINUED)		radial depth maximum and 4.000 inches (152.400 mm) circumferential length maximum with a 1.000 inch (25.400 mm) minimum separation	
		Keep a minimum wall thickness of:	
		0.178 inch (4.521 mm) for fan case detail PN 50G470.	
		0.173 inch (4.394 mm) for fan case detail PN 52G068, 52G158.	
		0.153 inch (3.886 mm) for fan case detail PN 51G544.	

NOTE: Blends directly opposite on the inner and outer walls are not permitted. For surface damage in areas adjacent to the handling pads, refer to Area P.

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Area C Rear inner and outer walls: Surface damage and corrosion	0.003 inch (0.076 mm) maximum depth if a minimum wall thickness in damaged area is kept.	0.012 inch (0.305 mm) radial depth maximum and 6.000 inches (152.400 mm) circumferential	Refer to Section 72-34-01, Repair-49 in the PW4000 Series CIR, PN 51A357.

ENGINE GENERAL − INTERMEDIATE CASE − INSPECTION/CHECK−10

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
(CONTINUED)		length maximum with a 1.000 inch (25.400 mm) minimum separation. Keep a minimum wall thickness of 0.108 inch (2.743 mm) Or 0.037 inch (0.940 mm) radial depth maximum and 4.000 inches (101.600 mm) circumferential length maximum with a 1.000 inch (25.400 mm) minimum separation. Keep a minimum wall thickness of 0.083 inch (2.108 mm)	

NOTE: Blends directly opposite on the inner and outer walls are not permitted. For surface damage in areas adjacent to the handling pads, refer to Area P.

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Area D Center flange inner wall: Corrosion	Not permitted	Remove superficial corrosion with no measurable depth	Refer to Section 72−34−01, Repair−49 in the PW4000 Series CIR, PN 51A357.

Outer Diameter Case Surface Visual Inspection
Table 801 (Continued)

R	Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
R	Area E Front inner wall: Surface damage and corrosion	Not permitted	0.035 inch (0.889 mm) radial depth maximum	Refer to Section 72−34−01, Repair−49 in the PW4000 Series CIR, PN 51A357.
R	Area F Front inner and outer walls: Individual surface damage at one location	0.003 inch (0.076 mm) depth maximum if a minimum wall thickness in damaged area is kept.	0.045 inch radial depth maximum, 0.160 inch (4.064 mm) axial width maximum and 0.500 inch (12.700 mm) circumferential length maximum	Refer to Section 72−34−01, Repair−49 in the PW4000 Series CIR, PN 51A357.
R			Location of the damage must be minimum 0.500 inch (12.700 mm) away from each fillet radius	
R			Keep a minimum wall thickness of 0.075 inch (1.905 mm)	
R			Blends directly opposite on the inner and outer walls are not permitted	

R NOTE: For surface damage in areas adjacent to the handling pads, refer to Area Q.

R Outer Diameter Case Surface Visual Inspection
R Table 801 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
General surface damage	Not permitted	0.015 inch (0.381 mm) radial depth maximum and 6.000 inches (152.400 mm) circumferential length maximum with a 1.000 inch (25.400 mm) minimum separation. Keep a minimum wall thickness of 0.105 inch (2.667 mm) Blends directly opposite on the inner and outer walls are not permitted	Refer to Section 72-34-01, Repair-49 in the PW4000 Series CIR, PN 51A357.

NOTE: For surface damage in areas adjacent to the handling pads, refer to Area Q.

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Area G Area rear of the V-groove: Surface damage	Not permitted	0.090 inch (2.286 mm) radial depth maximum, 0.180 inch (4.572 mm) axial width maximum and 0.400 inch (10.160 mm) circumferential length maximum. Maximum of one location	Refer to Section 72-34-01, Repair-49 in the PW4000 Series CIR, PN 51A357.

Table 801 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Area R			
Fillet radius from 1:30 to 4:30 o'clock and 7:30 to 10:30 o'clock for dents, nicks and scratches	Not permitted	0.008 inch (0.203 mm) depth maximum and 4.000 inches (101.600 mm) length maximum with a 1.000 inch (25.400 mm) minimum separation at a maximum of two locations	Refer to Section 72−34−01, Repair−49 in the PW4000 Series CIR, PN 51A357.

Outer Diameter Case Surface Visual Inspection
Table 801 (Continued)

ENGINE GENERAL - INTERMEDIATE CASE - INSPECTION/CHECK-10

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
1 All gaspath wall surfaces for: (Figure 802, Sheet 1)			
Cracks	Not permitted	See the repair	Refer to Section 72-34-01, Repair-31 in the PW4000 Series CIR, PN 51A357.
Nicks, dents, scratches, sharp edges and corrosion pits	0.003 inch (0.076 mm) depth maximum	Damage to a maximum of 0.020 inch (0.508 mm) depth, blend smooth	Manually blend the damage. Refer to Section 70-45-00, in the Standard Practices Manual, PN 585005.
Raised material	Not permitted	Smooth raised material	Manually smooth raised material. Refer to Section 70-45-00, in the Standard Practices Manual, PN 585005.
2 Gaspath struts for: (Figure 802, Sheet 1) thru (Figure 802, Sheet 5)			

Gaspath And Inner Diameter Structure Visual Inspection
Table 802

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Strut leading edge and trailing edge for scratches, nicks, dents and corrosion pits	0.003 inch (0.076 mm) depth maximum	0.100 inch (2.540 mm) depth maximum	Refer to Section 72−34−01, Repair−20 in the PW4000 Series CIR, PN 51A357.
Strut side walls for scratches, nicks, dents and corrosion pits	0.003 inch (0.076 mm) depth maximum	To a maximum of 0.020 inch (0.508 mm) depth	Refer to Section 72−34−01, Repair−20 in the PW4000 Series CIR, PN 51A357.
Holes or deep surface damage in strut side walls	Not permitted	1.500 inches (38.100 mm) by 3.000 inches (76.200 mm) maximum	Refer to Section 72−34−01, Repair−51 in the PW4000 Series CIR, PN 51A357.
3 No. 1 bearing support flange for: (If stage 4 LPC stator is removed) (Figure 802, Sheet 1)			
Cracks	Not permitted	See the repair	Refer to Section 72−34−01, Repair−31 in the PW4000 Series CIR, PN 51A357.

Gaspath And Inner Diameter Structure Visual Inspection
Table 802 (Continued)

R ENGINE GENERAL − INTERMEDIATE CASE − INSPECTION/CHECK−10

R	Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
R	Nicks, dents, other surface damage or wear	0.005 inch (0.127 mm) depth maximum. Smooth raised material	Smooth raised material	Refer to Section 72−34−01, Repair−20 in the PW4000 Series CIR, PN 51A357.
R	Helicoil inserts for damage, looseness	Not permitted	Install or replace helicoil insert	Refer to Section 72−34−01, Repair−16 in the PW4000 Series CIR, PN 51A357.
R	4 Stage 4 LPC stator flange for: (If stage 4 LPC stator is removed) (Figure 802, Sheet 1)			
R	Cracks	Not permitted	See the repair	Refer to Section 72−34−01, Repair−31 in the PW4000 Series CIR, PN 51A357.
R	Nicks, dents, other surface damage or wear	0.005 inch (0.127 mm) depth maximum. Smooth raised material	Smooth raised material	Refer to Section 72−34−01, Repair−20 in the PW4000 Series CIR, PN 51A357.

R Gaspath And Inner Diameter Structure Visual Inspection
R Table 802 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Helicoil inserts for damage and looseness	Not permitted	Install or replace helicoil insert	Refer to Section 72-34-01, Repair-31 in the PW4000 Series CIR, PN 51A357.
5 Fan exit case mount pads for: (Figure 802, Sheet 1)			
Cracks	Not permitted	See the repair	Refer to Section 72-34-01, Repair-31 in the PW4000 Series CIR, PN 51A357.
Nicks, dents, other surface damage or wear	0.005 inch (0.127 mm) depth maximum. Smooth raised material	Smooth raised material	Refer to Section 72-34-01, Repair-20 in the PW4000 Series CIR, PN 51A357.
Helicoil inserts for damage and looseness	Not permitted	Install or replace helicoil insert	Refer to Section 72-34-01, Repair-18 in the PW4000 Series CIR, PN 51A357.
6 Not gaspath surface areas (If inner liners are removed) for: (Figure 802, Sheet 1)			

Gaspath And Inner Diameter Structure Visual Inspection
Table 802 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Cracks	Not permitted	See the repair	Refer to Section 72-34-01, Repair-31 in the PW4000 Series CIR, PN 51A357.
Nicks, dents, other surface damage or wear	0.005 inch (0.127 mm) depth maximum. Smooth raised material	Smooth raised material	Refer to Section 72-34-01, Repair-20 in the PW4000 Series CIR, PN 51A357.
If you can access, check the helicoil inserts on the front side of the intermediate case for looseness or damage as follows:			
7 Strut oil tube boss, with helicoil inserts (Figure 802, Sheet 2)	Not permitted	Install or replace helicoil insert	Refer to Section 72-34-01, Repair-19 in the PW4000 Series CIR, PN 51A357.
8 Heat exchanger and air cooler bosses (2:00, 4:00 and 8:00 o'clock locations) Figure 802, Sheet 2)	Not permitted	Install or replace helicoil insert	Refer to Section 72-34-01, Repair-24 in the PW4000 Series CIR, PN 51A357.

Gaspath And Inner Diameter Structure Visual Inspection
Table 802 (Continued)

ENGINE GENERAL - INTERMEDIATE CASE - INSPECTION/CHECK-10

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
9 Inner oil tube boss (5:00 o'clock location) Figure 802, Sheet 2)	Not permitted	Install or replace helicoil insert	Refer to Section 72-34-01, Repair-19 in the PW4000 Series CIR, PN 51A357.
10 Boss (5:30 o'clock location) Figure 802, Sheet 2)	Not permitted	Install or replace helicoil insert	Refer to Section 72-34-01, Repair-19 in the PW4000 Series CIR, PN 51A357.
If you can access, check helicoil inserts on the rear side of the intermediate case for looseness or damage as follows:			
11 Solenoid mounts (two locations) (Figure 802, Sheet 3)	Not permitted	Install or replace helicoil insert	Refer to Section 72-34-01, Repair-107 in the PW4000 Series CIR, PN 51A357.

Gaspath And Inner Diameter Structure Visual Inspection
Table 802 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
12 Air/oil cooler inner mounts (Figure 802, Sheet 3)	Not permitted	Install helicoil insert inner mounts or replace helicoil insert	Refer to Section 72-34-01, Repair-107 in the PW4000 Series CIR, PN 51A357.
13 Flange E Figure 802, Sheet 3)	Not permitted	Install or replace helicoil insert	Refer to Section 72-34-01, Repair-19 in the PW4000 Series CIR, PN 51A357.
14 Bleed air valve mount (Figure 802, Sheet 3)	Not permitted	Install or replace helicoil insert	Refer to Section 72-34-01, Repair-107 in the PW4000 Series CIR, PN 51A357.
15 N1 probe outer mount boss for: (Figure 802, Sheet 3)			
Cracks	Not permitted	See the repair	Refer to Section 72-34-01, Repair-31 in the PW4000 Series CIR, PN 51A357.

Gaspath And Inner Diameter Structure Visual Inspection

R	Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
R	Surface wear	Not permitted	To a maximum of 0.015 inch (0.381 mm) depth	Refer to Section 72-34-01, Repair-87 in the PW4000 Series CIR, PN 51A357.
R	Loose or damaged helicoil inserts	Not permitted	Install or replace helicoil insert	Refer to Section 72-34-01, Repair-19 in the PW4000 Series CIR, PN 51A357.
R	16 N1 probe mount boss inner diameter for: (Figure 802, Sheet 4)			
R	Cracks	Not permitted	See the repair	Refer to Section 72-34-01, Repair-31 in the PW4000 Series CIR, PN 51A357.
R	Surface wear	To a maximum of 0.003 inch (0.076 mm)	To a maximum of 0.005 inch (0.127 mm) depth	Refer to Section 72-34-01, Repair-20 in the PW4000 Series CIR, PN 51A357.
R	Sharp edges, scratches and other irregular surface conditions.	Not permitted	To a maximum of 0.005 inch (0.127 mm) depth	Refer to Section 72-34-01, Repair-20 in the PW4000 Series CIR, PN 51A357.

R Gaspath And Inner Diameter Structure Visual Inspection
R Table 802 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Loose or damaged helicoil inserts	Not permitted	Install or replace helicoil insert	Refer to Section 72−34−01, Repair−19 in the PW4000 Series CIR, PN 51A357.
17 Front engine mount boss for: (Figure 802, Sheet 3)			
Surface damage	Not permitted	Surface damage can be repaired to a maximum of 0.013 inch (0.330 mm) depth on the rear face and on the inner flange to 0.039 inch (0.991 mm) depth	
18 Missing epoxy primer (Figure 802, Sheet 1)			
No. 1 bearing support mating flange	Not permitted	Replace epoxy primer	Refer to Section 72−34−01, Repair−45 in the PW4000 Series CIR, PN 51A357.
Stage 4 stator mating flange	Not permitted	Replace epoxy primer	Refer to Section 72−34−01, Repair−45 in the PW4000 Series CIR, PN 51A357.

Gaspath And Inner Diameter Structure Visual Inspection
Table 802 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Fan exit inner case mating flange	Not permitted	Replace epoxy primer	Refer to Section 72-34-01, Repair-45 in the PW4000 Series CIR, PN 51A357.
Angle gearbox inner diameter	Not permitted	Replace epoxy primer	Refer to Section 72-34-01, Repair-45 in the PW4000 Series CIR, PN 51A357.
19 Case struts for: (Figure 802, Sheet 1)			
Cracks	Not permitted	See the repair	Refer to Section 72-34-01, Repair-33 in the PW4000 Series CIR, PN 51A357.
20 Intermediate case strut sealant for: (Figure 802, Sheet 1)			
Missing pieces, tears or looseness	Not permitted	Seal must be replaced	Refer to Section 72-34-01, Repair-46 in the PW4000 Series CIR, PN 51A357.

Gaspath And Inner Diameter Structure Visual Inspection
Table 802 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
21 No. 2 bearing support flange (Figure 802, Sheet 3)			
Surface damage	Not permitted	Damage to a maximum of 0.015 inch (0.381 mm) depth can be repaired	Refer to Section 72−34−01, Repair−20 in the PW4000 Series CIR, PN 51A357.

Gaspath And Inner Diameter Structure Visual Inspection
Table 802 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
1 Fan exit case, rear flange (D1), all areas for: (Figure 803, Sheet 1)			
Cracks	Not permitted	See the repair	Refer to Section 72-34-01, Repair-47 in the PW4000 Series CIR, PN 51A357.
Wear or galling	0.003 inch (0.076 mm) depth maximum	To a maximum of 0.025 inch (0.635 mm) depth	Refer to Section 72-34-01, Repair-117 in the PW4000 Series CIR, PN 51A357.
		More than 0.025 inch (0.635 mm) replace the flange	Refer to Section 72-34-01, Repair-95 in the PW4000 Series CIR, PN 51A357.
Fan exit case flange, (D1) Area A, 12:00 o'clock bracket only for:			
Bent or cracked flange	Not permitted	Flange can be repaired to a maximum of 0.030 inch (0.762 mm) depth and to a maximum length of 0.220 inch (5.588 mm).	Refer to Section 72-34-01, Repair-47, Repair-50 in the PW4000 Series CIR, PN 51A357.

Rear Surfaces, Mounts And Flange Visual Inspection
Table 803

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Fan exit case flange, (D1) Area A, full circumference for:			
Bent flange	To a maximum of 0.015 inch (0.381 mm) deflection	To a maximum of 0.250 inch (6.350 mm) depth of blend and 3.000 inches (76.200 mm) length of blend	Refer to Section 72-34-01, Repair-50 in the PW4000 Series CIR, PN 51A357.
		More than 0.250 inch (6.350 mm) or more than 3.000 inches (76.200 mm)	Refer to Section 72-34-01, Repair-95 in the PW4000 Series CIR, PN 51A357.
Fan exit case flange, (D1) Area A, all around for:			
Surface damage and galling	To a maximum of 0.010 inch (0.254 mm) with no sharp edges	0.015 inch (0.381 mm) maximum depth or replace the flange	Refer to Section 72-34-01, Repair-44 in the PW4000 Series CIR, PN 51A357.
		More than 0.015 inch (0.381 mm) depth replace the flange	Refer to Section 72-34-01, Repair-95 in the PW4000 Series CIR, PN 51A357.

Rear Surfaces, Mounts And Flange Visual Inspection
Table 803 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Fan exit case flange, (D1) Area B, 1:00 o'clock position for:			
Surface damage	Not permitted	To a maximum of 0.030 inch (0.762 mm) depth and 0.100 inch (2.540 mm) maximum length	Refer to Section 72−34−01, Repair−50 in the PW4000 Series CIR, PN 51A357.
		More than 0.030 inch (0.762 mm) depth or 0.100 inch (2.540 mm) length replace the flange	Refer to Section 72−34−01, Repair−95 in the PW4000 Series CIR, PN 51A357.
Fan exit case flange, (D1) Area C, all around for:			
Surface damage and galling	Not permitted	To a maximum of 0.015 inch (0.381 mm) depth from the initial surface	Refer to Section 72−34−01, Repair−44 in the PW4000 Series CIR, PN 51A357.
		More than 0.015 inch (0.381 mm) depth replace the flange	Refer to Section 72−34−01, Repair−95 in the PW4000 Series CIR, PN 51A357.

Rear Surfaces, Mounts And Flange Visual Inspection
Table 803 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Raised material or sharp edges	Not permitted	Remove damage and polish	Refer to Section 72-34-01, Repair-44 in the PW4000 Series CIR, PN 51A357.
Areas adjacent to the flange nut plates	Not permitted	Repair damage to a maximum of 0.220 inch (5.588 mm) long by 0.145 inch (3.683 mm) wide by 0.045 inch (1.143 mm) deep maximum	Refer to Section 72-34-01, Repair-44 in the PW4000 Series CIR, PN 51A357.
		More than 0.220 inch (5.588 mm) long or 0.145 inch (3.683 mm) wide or 0.045 inch (1.143 mm) depth, replace the flange	Refer to Section 72-34-01, Repair-95 in the PW4000 Series CIR, PN 51A357.
Flange slot surfaces for damage and wear	Not permitted	To a maximum of 0.205 inch (5.207 mm) long by 0.045 inch (1.143 mm) depth maximum or replace flange	
2 Flange nut plates and flange covers for: (Figure 803, Sheet 1)

(CONTINUED)			
		(0.508 mm)	
		To a maximum of 50 percent of the fairing surface and more than 0.020 inch (0.508 mm) depth	Refer to Section 72-34-01, Repair-102 in the PW4000 Series CIR, PN 51A357.
Surface erosion	Not permitted	To a maximum of 50 percent of the fairing surface with a maximum depth of 0.020 inch (0.508 mm)	Refer to Section 72-34-01, Repair-04, Repair-22, Repair-34 in the PW4000 Series CIR, PN 51A357.
		To a maximum of 50 percent of the fairing surface and more than 0.020 inch (0.508 mm) depth	Refer to Section 72-34-01, Repair-102 in the PW4000 Series CIR, PN 51A357.
Wire mesh unbonded from laminate, holes or tears	Not permitted	Complete replacement of wire mesh is permitted. You can rebond to a maximum of 9.000 sq-in (5806. sq-mm)	Refer to Section 72-34-01, Repair-102 in the PW4000 Series CIR, PN 51A357.
Viton coated fairing configuration:			

Strut Fairing And Fan Exit Liner Visual Inspection
Table 805 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Viton erosion damage that includes tears, holes and disbonds from the laminate substrate	Not permitted	Full viton replacement is permitted	Refer to Section 72−34−01, Repair−120 in the PW4000 Series CIR, PN 51A357.
Laminate substrate erosion damage including broken fibers, punctures and delamination	Not permitted	To a maximum of 50 percent of the fairing surface	Refer to Section 72−34−01, Repair−120 in the PW4000 Series CIR, PN 51A357.
Delamination in the fairing substrate	Not permitted	To a maximum of 50 percent of the fairing surface	Refer to Section 72−34−01, Repair−120 in the PW4000 Series CIR, PN 51A357.
NOTE: Total area of fairing laminate repairs not more than 50 percent of fairing surface.			
Aluminum fairing material configuration			
Cracks, tears and holes	Not permitted	Replace fairings	Refer to Section 72−34−01, Repair−34 in the PW4000 Series CIR, PN 51A357.

Strut Fairing And Fan Exit Liner Visual Inspection
Table 805 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Nicks and scratches	To a maximum of 0.015 inch (0.381 mm) depth. No raised material or sharp edges.	Blend damage, no raised material is permitted	Refer to Section 72−34−01, Repair−105 in the PW4000 Series CIR, PN 51A357.
		Above 0.015 inch (0.381 mm) depth of damage, replace fairing	Refer to Section 72−34−01, Repair−34 in the PW4000 Series CIR, PN 51A357.
Dents	To a maximum of 0.100 inch (2.540 mm) depth and 0.075 inch (1.905 mm) minimum distance from an edge.	To a maximum of 0.250 inch (6.350 mm) depth maximum with no cracking	Refer to Section 72−34−01, Repair−106 in the PW4000 Series CIR, PN 51A357.
		More than 0.250 inch (6.350 mm) deep, replace the fairing	Refer to Section 72−34−01, Repair−34 in the PW4000 Series CIR, PN 51A357.
2 Fan exit outer liner segment assemblies for: (Figure 805, Sheet 1)			

Strut Fairing And Fan Exit Liner Visual Inspection
Table 805 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Loose or disbonded washers	Not permitted	Replace or rebond washer	Refer to Section 72-34-70, Repair-10 in the PW4000 Series CIR, PN 51A357.
Tears, holes and punctures in the wire mesh indentations	Not permitted	To a maximum of 25 percent of the liner surface and 1.000 inch (25.400 mm) diameter each incident of damage with a 1.000 inch (25.400 mm) separation between each incident of damage or replace liner	Refer to Section 72-34-70, Repair-01, Repair-02, Repair-04 in the PW4000 Series CIR, PN 51A357.
		More than 25 percent of the liner surface or 1.000 inch (25.400 mm) diameter. Full wire mesh replacement is permitted	Refer to Section 72-34-70, Repair-04 in the PW4000 Series CIR, PN 51A357.
Nicks, dents and scratches	To a maximum of 0.020 inch (0.508 mm) depth	To a maximum of 25 percent of the liner surface or replace liner	Refer to Section 72-34-70, Repair-01, Repair-02, Repair-04 in the PW4000 Series CIR, PN 51A357.
			Or

ENGINE GENERAL - INTERMEDIATE CASE - REPAIR-01

Task 72-00-34-300-001:

1. Install Helical Coil Inserts In The Screw Thread Inserts In The Ground Handling Pad

A. Equipment and Materials

Repair Details:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIGURE	ITEM
Insert, Helical Coil	AR	72-34-00	4 or 4A	430

B. Procedure

See Figure 901.

(1) Remove the bolt(s) in the ground handling pad.

(a) Cut off the top of the bolt that is in the screw thread insert in the ground handling pad at 12 o'clock.

(b) Drill through the bolt. Try to remove the bolt with a multi-spline screw extractor.

(c) If you can not remove the bolt with the extractor, drill out the rest of the bolt.

(2) If extraction of the bolt was not possible, install a helicoil insert.

(a) Put new threads in the screw thread insert. The threads must be for a .500-20 x .750 helical coil insert.

(b) Install a helical coil insert in the screw thread insert. Install it 1 - 1.5 pitch below the surface of the screw thread insert.

C. Postrequisites

(1) If the screw thread insert is damaged so badly that installation of the helical coil insert is not possible, remove the fan case and install a new screw thread. insert. Refer to 72-00-33, Removal-01 (Task 72-00-33-020-001) and 72-00-34, Repair-02 (Task 72-00-34-300-002).

ENGINE GENERAL - INTERMEDIATE CASE - REPAIR-02

Task 72-00-34-300-002:

1. Replace The Screw Thread Inserts In The Ground Handling Pad

A. Prerequisites

(1) Remove the fan case. Refer to 72-00-33 (Task 72-00-33-020-001).

B. Equipment and Materials

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521, Type II)
P09-027	Sealant, Silicone Rubber (PWA 36003-2)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Collar	4	72-34-00/4 or 4A/270
Pin, Rivet	4	72-34-00/4 or 4A/260
Rivet	13	72-34-00/9 or 9A/70
Rivet	4	72-34-00/9 or 9A/210
or		
Rivet	4	72-34-00/9 or 9A/220

Repair Details:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Insert, Screw Thread	AR	72-34-00/4 or 4A/220

C. Procedure
See Figure 901.

Subtask 72-00-34-350-053:

(1) Remove the fan exit liner segment assemblies.

(a) Cut the sealant around the fan exit liner segment assemblies at 1 and 11 o'clock. Remove the screws. Remove the fan exit liner segment assemblies.

(b) Cut the sealant around the fan exit liner segment assemblies on either side of the 12 o'clock strut.

(c) If applicable, remove a screw from each liner segment assembly.

(d) Grind or drill the rivets that attach the fan exit liner segment assemblies to the strut and the case.

(e) Remove the fan exit liner segment assemblies.

(2) Remove the screw thread insert.

CAUTION: DO NOT DAMAGE THE STRUT WHEN YOU GRIND THE FILLET WELDS AROUND THE SCREW THREAD INSERTS.

(a) Grind the fillet weld of the screw thread insert.

(b) Remove the screw thread insert.

NOTE: There is an interference fit between the inserts and the strut.

(c) If necessary, remove the four rivet pins.

(3) Install the new insert.

(a) If the rivet pins were removed, install new ones.

(b) Install the new screw thread insert.

R (c) Weld the new insert. Use PWA 16−22 (Task
R 70−42−01−310−004), but use AMS 5680 welding wire.

(4) Apply a corrosion preventive coating to the strut at 12 o'clock. Refer to the referenced figure. Use SPOP 152
R (Task 70−41−03−380−010).

(5) Install the fan exit liner segment assemblies that attach to the strut.

(a) Align the holes in the fan exit liner segment assemblies and brackets with the mating holes in the case. Attach the fan exit liner segment assemblies to the strut and case with rivets.

(b) (Post SB PW4ENG 72−263) Apply Engine Oil P03−001 to the threads of two screws. Install the screws in the fan exit liner segment assemblies. With a No. 10 Torq−set Drive, torque the screws to 36 − 40 lb−in. (4.067 − 4.059 N.m).

(c) Clean the areas of the strut, case, and liners where there will be sealant. Use PWA 83−A4 (Task 70−48−00−360−001).

(d) Apply Sealant P09−027 to the gap at the edges of the liners. Cure the sealant at room temperature, in air that has a relative humidity of 25 percent, for two hours, minimum.

D. Postrequisites

(1) Install the fan exit liner segment assemblies at 1 and 11 o'clock. Refer to 72−34−01, Repair−28 Task 72−34−01−300−028.

(2) Install the fan case. Refer to 72−00−33, Installation−01 Task 72−00−33−420−001.

ENGINE GENERAL - INTERMEDIATE CASE - REPAIR-03

Task 72-00-34-300-003:

1. Replace Or Bond An Intermediate Case Strut Seal

NOTE: This repair replaces a damaged seal or bonds a loose seal.

A. Equipment And Materials

Consumable Materials:

Item No.	Designation
P05-133	Mold Release (PWA 36007)
P09-027	Sealant Silicone Rubber (PWA 36003-2)

Repair Details:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIGURE	ITEM
Seal	AR	72-34-00	4A	345

B. Procedure

See Figure 901.

Subtask 72-00-34-350-051:

(1) If the seal is damaged, mechanically remove the old seal fully. If part of the seal is loose, but the seal is not damage, do not remove it.

Subtask 72-00-34-360-001-002:

(2) Clean the surfaces of the case. Use PWA 83-A4 (Task 70-48-00-360-001).

Subtask 72-00-34-350-052:

(3) Cut the seal to fit the repair area.

NOTE: Do not do this step if you do not replace the seal.

Subtask 72-00-34-360-001-003:

(4) Clean the bonding surfaces of the seal. Use PWA 83-D1 (Task 70-48-00-360-001).

Subtask 72-00-34-360-051:

(5) Apply a layer of Mold Release (P05-133) to a form.

ENGINE GENERAL − HIGH PRESSURE COMPRESSOR (HPC) − REMOVAL−01

Task 72−00−35−020−001:

1. Remove The HPC

NOTE: See Figure 301 for part/assembly removal procedure sequence.

A. Prerequisites

(1) Remove The Intermediate Case. Refer to 72−00−34, Removal−01 (Task 72−00−34−020−001).

(2) Remove The Diffuser And Combustor. Refer to 72−00−41, Removal−01 (Task 72−00−41−020−001).

(3) Remove The External Plumbing From The High Pressure Compressor. Refer to Removal−03 (Task 72−00−35−020−002).

B. Equipment And Materials Required

Standard Wrenching Tools:

Hydraulic:

PWA 18872	Wrench, Hydraulic
Or	
PWA 33732	Wrench, Hydraulic
Or	
PWA 87354	Wrench, Hydraulic
Or	
PWA 80070	Wrench System, Hydraulic (Includes Pump, Cart, Wrench)
PWA 29510	Pump, Hand (2 Hose)
Or	
PWA 28814	Pump, Electric (2 Hose)
PWA 28815	Cart, Storage (Optional)
Or	
PWA 28825	Cart, Storage (Optional)
Or	
PWA 75046	Cart, Storage (Optional)

Mechanical:

PWA 45418	Wrench, Mechanical
Or	
PWA 80071	Wrench, Mechanical
Or	
PWA 80187	Wrench, Mechanical
PWA 45419	Multiplier, Pneumatic

Standard Wrenching Tools:

(CONTINUED)

	Or	
	PWA 80651	Multiplier, Pneumatic (Do Not Use With PWA 45418)
	PWA 85375	Plate, Anchor (Do Not Use With PWA 80071)
	Or	
	PWA 88100	Plate, Anchor

Special Tools:

	PWA 3755	Pump, Hydraulic (1 Hose)
	Or	
	PWA 29389	Pump, Hydraulic (1 Hose)
	PWA 76154	Adapter, Sling (4 Necessary)
	PWA 85031	Puller (No. 2 Bearing And Seal Assembly)
	PWA 85530	Wrench, Torque (HPC Rear Hub Nut)
R	PWA 85535	Nut, Retaining (HPC Rear Hub)
	Or	
	PWA 88701	Nut, Retaining (HPC Rear Hub)
	PWA 85536	Adapter, Torque (HPC Rear Hub Nut)
	PWA 85537	Fixture, Handling (HPC Front Case − With Symmetric Case)
	Or	
	PWA 88560	Fixture, Handling (HPC Front Case − With Asymmetric Case)
	PWA 86155	Wrench (No. 2 Bearing Retaining Ring Bolts)
	PWA 88643	Sling (2 Necessary)
	Or	
	PWA 88673	Sling (2 Necessary)
R	PWA 107219	Fixture, Handling (HPC Rear)

Special Tools (Hydraulic Wrenching):

PWA 85510	Wrench (Front Seal Seat Nut)
PWA 85512	Wrench (No. 2 Bearing Nut)
PWA 86002	Retainer (Adapter To HPC Front Hub)
PWA 86596	Adapter, Holding (HPC Front Hub)

Special Tools (Mechanical Wrenching):

PWA 85032	Adapter, Holding (HPC Front Hub)
PWA 85033	Wrench (No. 2 Bearing Nut)
PWA 85034	Wrench (No. 2 Front Seal Seat Nut)
PWA 86002	Retainer (Adapter To HPC Front Hub)

C. Procedure

(1) Lift and turn the HPC (to front end up) as follows. See Figure 302 and Figure 303.

- (a) Put two PWA 76154 Adapters on the PWA 88643 or PWA 88673 Sling.
- (b) Lift the Sling with a hoist.
- (c) Attach the Sling (with the Adapters) to the trunnion spools of the PWA 107219 Fixture. R
- (d) Put the Fixture on the rear of the HPC with a hoist.
- (e) Attach the Fixture to the HPC rear case with the detail screws.
- (f) Remove the Sling and Adapters.
- (g) (Pre SB PW4ENG 72−562) Install the PWA 85535 Nut to the HPC rear hub.
- (h) (Post SB PW4ENG 72−562 − Phase III Engines) Install the PWA 88701 Nut to the HPC rear hub.
- (i) Install the PWA 85530 Wrench to the Nut.
- (j) Install the PWA 85536 Adapter to the HPC rear hub.
- (k) Use standard wrenches to hold the Adapter and tighten the Nut.
- (l) Lift the HPC with the hoist.
- (m) Attach the PWA 85537 Fixture (for HPC symmetric case) or the PWA 88560 Fixture (for HPC asymmetric case) to the front of the HPC as follows.
    - 1 Use the hoist and lift the HPC over the Fixture.
    - 2 Attach the Fixture to the HPC front case flange with 36 detail screws, washers, and nuts.
    - 3 Attach the Fixture to the No. 2 bearing and seal assembly with the 17 detail screws.
- (n) Use the hoist and lift the HPC.

(o) Attach a second hoist with a PWA 88643 Sling or PWA 88673Sling and PWA 76154 Adapters to the front Fixture.

(p) Turn the HPC to front end up and install the HPC in a Stand.

(q) Remove the front Fixture and all hoists, Slings, and Adapters.

(2) Remove the retaining ring [1] and key washer [2] which hold the No. 2 bearing front seal seat [4] and nut [3]. See Figure 304.

(3) For operators that use the mechanical wrenching tools, remove the No. 2 bearing front seal seat nut [3] as follows. See Figure 305.

(a) Engage the PWA 85032 Adapter teeth to the HPC front hub and attach it with the PWA 86002 Retainer as follows.

1 Install the Retainer through the Adapter and engage the inside of the HPC hub with the detail foot.

2 Install the slotted washer.

3 Tighten the detail nut to make the Adapter tight on the HPC hub.

(b) Install the PWA 85034 Wrench teeth to the nut [3].

(c) Use the standard mechanical wrenching tools (from the Standard Wrenching Tools list) to loosen the nut [3].

(d) Remove the Wrenches.

(e) Remove the nut [3]. Discard the nut.

NOTE: When the nut [3] is removed, it must not be re−used. The nut must be replaced with a new nut.

(4) For operators that use the hydraulic wrenching tools, remove the No. 2 bearing front seal seat nut [3] as follows. See Figure 306.

(a) Engage the PWA 86596 Adapter teeth to the HPC front hub and attach it with the PWA 86002 Retainer as follows.

1 Install the Retainer through the Adapter and engage the inside of the HPC hub with the detail foot.

2 Install the slotted washer.

3 Tighten the detail nut to make the Adapter tight on the HPC hub.

(b) Install the PWA 85510 Wrench teeth to the nut [3].

(c) Use the standard hydraulic wrenching tools (from the Standard Wrenching Tools list) to loosen the nut [3].

(d) Remove the Wrenches.

(e) Remove the nut [3]. Discard the nut.

NOTE: When the nut [3] is removed, it must not be re−used. The nut must be replaced with a new nut.

(5) Remove the No. 2 bearing front seal seat [4]. See Figure 307.

(6) Remove the retaining ring [10] and key washer [11] which hold the No. 2 bearing nut [12]. See Figure 307.

(7) For operators that use the mechanical wrenching tools, remove the No. 2 bearing nut [12] as follows. See Figure 308.

(a) Install the PWA 85033 Wrench over the Adapter that is installed to the HPC front hub.

(b) Engage the teeth of the Wrench in the slots of the retaining nut [12].

(c) Use the standard mechanical wrenching tools (from the Standard Wrenching Tools list) to loosen the nut [12].

(d) Remove the tools.

(e) Remove the nut [12] and lock [20].

(8) For operators that use the hydraulic wrenching tools, remove the No. 2 bearing nut [12] as follows. See Figure 309.

(a) Install PWA 85512 or PWA 85033 Wrench over the Adapter that is installed to the HPC front hub.

(b) Engage the teeth of the Wrench in the slots of the retaining nut [12].

(c) Use the standard hydraulic wrenching tools (from the Standard Wrenching Tools list) to loosen the nut [12].

(d) Remove the tools.

(e) Remove the nut [12] and lock [20].

(9) Remove the No. 2 bearing and seal assembly as follows. See Figure 310.

(a) Turn the No. 2 bearing and seal assembly to unlock the tabs on the rear flange from the HPC.

(b) Remove the detail ring from PWA 85031 Puller.

(c) Loosen the detail hand knobs of the Puller.

(d) Put the detail plate in the end of the HPC front hub. Put the detail jaws over the teeth of the gearbox drive bevel gear.

(e) Install the detail ring on the Puller. Tighten the detail hand knobs.

(f) Attach PWA 3755 or PWA 29389 Pump to the Puller.

(g) Loosen the No. 2 bearing and seal assembly.

(h) Remove the tools.

(i) With a hoist and sling, remove the No. 2 bearing and seal assembly.

(j) Put the assembly on a bench.

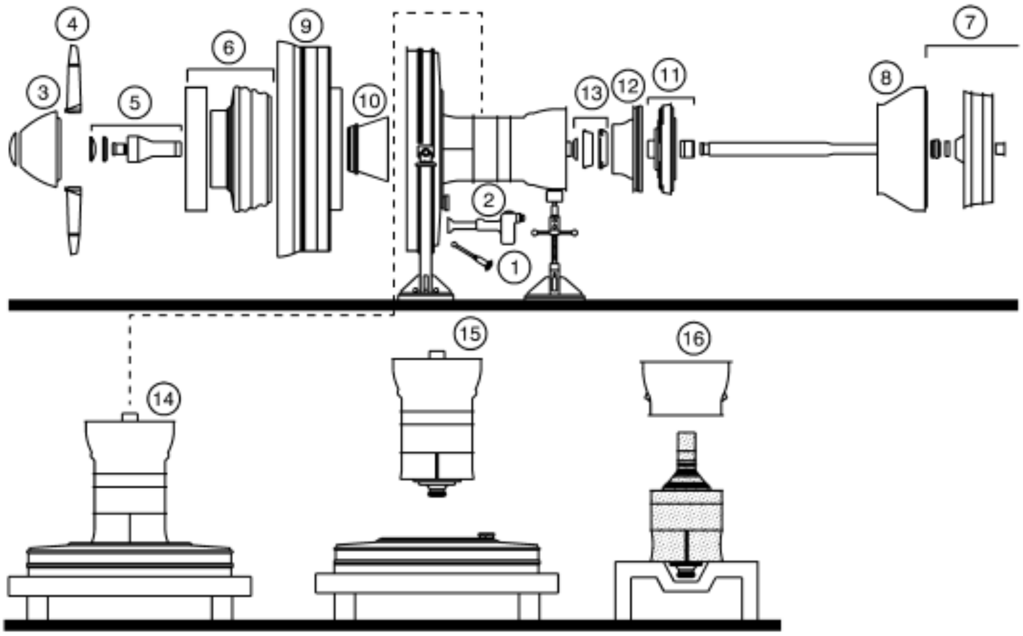
(10) If applicable, remove the 5th stage HPC shroud retaining ring (Post SB PW4ENG 72−204) as follows. See Figure 311.

  (a) Use the PWA 86155 Wrench to remove the bolts that attach the ring to the No. 2 bearing and seal assembly.

  (b) Remove the ring.

(11) Cover the No. 2 bearing and seal assembly and the HPC inlet.

(12) Make sure that you install all the necessary protection covers.



1. REMOVE ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).
2. REMOVE MAIN GEARBOX.
3. REMOVE COMPRESSOR INLET CONE.
4. REMOVE STAGE 1 LPC BLADE ASSEMBLIES.
5. REMOVE LPC/LPT COUPLING.
6. REMOVE LOW PRESSURE COMPRESSOR (LPC).
7. REMOVE TURBINE EXHAUST CASE.
8. REMOVE LOW PRESSURE TURBINE (LPT).
9. REMOVE FAN CASE.
10. REMOVE NO. 1 BEARING SUPPORT ASSEMBLY.
11. REMOVE HIGH PRESSURE TURBINE (HPT).
12. REMOVE TURBINE NOZZLE.
13. REMOVE NO. 3 BEARING REAR SEAL ASSEMBLY AND REAR SEAL PLATE.
14. TRUNNION INTERMEDIATE THROUGH DIFFUSER CASE TO FRONT END DOWN.
15. REMOVE DIFFUSER AND HIGH PRESSURE COMPRESSOR FROM INTERMEDIATE CASE.
16. REMOVE DIFFUSER AND COMBUSTOR FROM HIGH PRESSURE COMPRESSOR.

Task 72-00-35-020-001-002:

1. Remove The No. 2 Bearing Seal Seat - Horizontal

NOTE: See Figure 301 for part/assembly removal procedure sequence.

A. Prerequisites

(1) Remove The EEC Speed Transducer (N1) Multiplexer Input Probe. Refer to 72-00-34, Removal-17 (Task 72-00-34-050-014).

(2) Remove The Compressor Inlet Cone. Refer to 72-00-31, Removal-02 (Task 72-00-31-020-001).

(3) Remove All The Stage 1 LPC (Fan) Blade Assemblies. Refer to 72-00-31, Removal-04 (Task 72-00-31-020-002-002).

(4) Remove The LPC/LPT Coupling. Refer to 72-00-32, Removal-01 (Task 72-00-32-020-001).

(5) Remove The Low Pressure Compressor (LPC). Refer to 72-00-31, Removal-01 (Task 72-00-31-020-003).

(6) Remove The Low Pressure Turbine And Turbine Exhaust Case. Refer to 72-00-53, Removal-08 (Task 72-00-53-020-002).

(7) Remove The No. 1 Bearing Support (Front And Rear) Assembly. Refer to 72-00-34, Removal-04 (Task 72-00-34-050-002).

(8) Remove The No. 1.5 Bearing Support Assembly. Refer to 72-00-34, Removal-06 (Task 72-00-34-030-001).

B. Equipment And Materials Necessary

Standard Wrenching Tools:

Hydraulic:

PWA 18872	Wrench, Hydraulic
Or	
PWA 33732	Wrench, Hydraulic

NOTE: Do not use PWA 87354 or PWA 80070 Hydraulic Wrenches to do this procedure. These

Standard Wrenching Tools:

(CONTINUED)

wrenches are too heavy and apply too much torque for this horizontal application.

PWA 29510	Pump, Hand (2 Hose)
Or	
PWA 28814	Pump, Electric (2 Hose)
PWA 28815	Cart, Storage (Optional)
Or	
PWA 28825	Cart, Storage (Optional)
Or	
PWA 75046	Cart, Storage (Optional)

Mechanical:

PWA 45418	Wrench, Mechanical
Or	
PWA 80187	Wrench, Mechanical

NOTE: Do not use the PWA 80071 Mechanical Wrench to do this procedure. This wrench is too heavy and applies too much torque for this horizontal application.

PWA 45419	Multiplier, Pneumatic
Or	
PWA 80651	Multiplier, Pneumatic (Do Not Use With PWA 45418)
PWA 85375	Plate, Anchor
Or	
PWA 88100	Plate, Anchor

Special Tools:

R	PWA 85368	Arm, Lifting
	PWA 85530	Wrench, Torque (HPC Rear Hub Nut)
R	PWA 106464	Adapter, Lift

Special Tools (Hydraulic Wrenching):

PWA 85510	Wrench (Front Seal Seat Nut)
PWA 86002	Retainer (Adapter To HPC Front Hub)
PWA 86596	Adapter, Holding (HPC Front Hub)

Special Tools:

(CONTINUED)

Special Tools (Mechanical Wrenching):

PWA 85032	Adapter, Holding (HPC Front Hub)
PWA 85034	Wrench (No. 2 Front Seal Seat Nut)
PWA 86002	Retainer (Adapter To HPC Front Hub)

C. Procedure

(1) For operators that use the mechanical wrenching tools, remove the No. 2 bearing front seal seat nut [4] as follows. See Figure 302 (Sheet 1) and Figure 302 (Sheet 2).

(a) Remove the retaining ring [2] and key washer [1] which hold the No. 2 bearing front seal seat nut [4].

(b) Engage the PWA 85032 Adapter teeth to the HPC front hub and attach it with the PWA 86002 Retainer as follows.

1 Install the Retainer through the Adapter and engage the inside of the HPC hub with the detail foot.

2 Install the slotted washer.

3 Tighten the detail nut to make the Adapter tight on the HPC hub.

(c) Install the PWA 85034 Wrench teeth to the nut [4].

R (d) Use the PWA 85368 Lifting Arm with the PWA 106364
R Lift Adapter and the standard mechanical wrenching tools (from the Standard Wrenching Tools list) to loosen the nut [4].

NOTE: You must fabricate an adapter that will attach the wrench to the Handling Fixture. This adapter must safely lift 125 lbs (56.70 kg) minimum.

(e) Remove the tools.

(2) For operators that use the hydraulic wrenching tools, remove the No. 2 bearing front seal seat nut [4] as follows. See Figure 303 (Sheet 1) and Figure 303 (Sheet 2).

(a) Remove the retaining ring [2] and key washer [1] which hold the No. 2 bearing front seal seat nut [4].

(b) Engage the PWA 86596 Adapter teeth to the HPC front hub and attach it with the PWA 86002 Retainer as follows.

1 Install the Retainer through the Adapter and engage the inside of the HPC hub with the detail foot.

2 Install the slotted washer.

3 Tighten the detail nut to make the Adapter tight on the HPC hub.

(c) Install the PWA 85510 Wrench teeth to the nut [4].

R
R (d) Use the PWA 85368 Lifting Arm with the PWA 106364 Lift Adapter and the standard mechanical wrenching tools (from the Standard Wrenching Tools list) to loosen the nut [4].

NOTE: You must fabricate an adapter that will attach the wrench to the Handling Fixture. This adapter must safely lift 125 lbs (56.70 kg) minimum.

(e) Remove the tools.

(3) Remove the nut [4] and No. 2 bearing front seal seat [3]. Discard the nut. See Figure 304.

NOTE: When the nut [4] is removed, it must not be re−used. The nut must be replaced with a new nut.

(4) Make sure that you install all the necessary protection covers.

ENGINE GENERAL - HIGH PRESSURE COMPRESSOR (HPC) - REMOVAL-03

Task 72-00-35-020-002:

1. Remove External Plumbing From High Pressure Compressor

   A. Equipment And Materials Required - None

   B. Procedure

      See Figures 301 and 302.

      NOTE: FOR THESE MODELS: 4152, 4156A, 4158
      HPC air valve signal tubes were removed and cap assemblies installed on the air filters and the HPC air valves by Alert SB PW4ENG 75-62R2.

      HPC air valve signal tube was (re)installed and the cap assemblies were removed from the air filter and the HPC air valve by SB PW4ENG 75-85 and SB PW4ENG 75-116.

      (1) FOR THESE MODELS: 4152, 4156A, 4158
      (Pre SB PW4ENG 75-102 and SB PW4ENG 75-116) Remove the air shutoff valve signal manifold assembly (left) (AA19) as follows.

         (a) FOR THESE MODELS: 4152, 4156A, 4158
         Remove lockwire and disconnect manifold nuts from rear of upper left air filter at approximately the 11 o'clock position and from air shutoff valve at approximately the 10 o'clock position. Disconnect tube nut from manifold tee and remove tube from engine.

         (b) FOR THESE MODELS: 4152, 4156A, 4158
         Install protective closures.

      (2) FOR THESE MODELS: 4152, 4156A, 4158
      (Post SB PW4ENG 75-102 and SB PW4ENG 75-116) Remove the air shutoff valve signal manifold assembly (left) (AA19) as follows.

         (a) FOR THESE MODELS: 4152, 4156A, 4158
         Remove lockwire and disconnect manifold nuts from rear of upper left air filter at approximately the 11 o'clock position and from air shutoff valve at approximately the 10 o'clock position. Remove the tube from engine.

         (b) FOR THESE MODELS: 4152, 4156A, 4158
         Install protective closures.

(3) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the air shutoff valve signal manifold assembly (left) (AA19) as follows.

  (a) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
  Remove lockwire and disconnect manifold nuts from rear of upper left air filter at approximately the 11 o'clock position and from air shutoff valve at approximately the 10 o'clock position. Remove tube from engine.

(4) FOR THESE MODELS: 4152, 4156A, 4158
(Post SB PW4ENG 75−85 and SB PW4ENG 75−116) Remove the HPC air valve signal tube assembly (AA16) on the left side of the engine.

  (a) FOR THESE MODELS: 4152, 4156A, 4158
  Remove the lockwire and disconnect the tube nuts from the rear of the lower left air filter at approximately the 11 o'clock position and from the secondary flow control air valve at approximately the 10 o'clock position.

  (b) FOR THESE MODELS: 4152, 4156A, 4158
  Remove the bolt, nut and clamp that attach the tube to a bracket that is attached to the turbine vane and blade cooling air valve.

  (c) FOR THESE MODELS: 4152, 4156A, 4158
  Remove the tube from the engine and install protection covers.

(5) Remove air supply manifold assembly (AA24) as follows.

  (a) Remove the lockwire and disconnect the manifold nut from the front upper right air filter at approximately the 2 o'clock position.

  (b) Remove bolts, nuts, and clamps that attach the manifold to the bracket below and the bracket rear of the turbine cooling air valve actuator at approximately the 2 o'clock position. Remove the tube from engine and install protective closures.

(6) Remove the (right) bleed valve supply tube assembly (AA28) as follows.

(a) Remove the lockwire and disconnect the tube nut from the right side HPC bleed valve at approximately the 1 o'clock position.

(b) Remove bolt, nut, and clamp that attaches the tube to the Flange J bracket at approximately the 1 o'clock position.

(c) Remove bolts, nuts, and clamps that attach the tube to the bracket below and the bracket rear of the turbine cooling air valve actuator at approximately the 2 o'clock position. Remove the tube from engine and install protective closures.

(7) Remove the (left) bleed valve supply tube assembly (AA30) as follows.

(a) Remove the lockwire and disconnect the tube nut from the left side HPC bleed valve at approximately the 11 o'clock position.

(b) Remove bolts, nuts, and clamps that attach the tub to the bracket below and bracket rear of the turbine cooling air valve actuator at approximately the 2 o'clock position.

(c) Remove bolts, nuts, and clamps that attach the tube to the Flange J brackets at approximately the 1, 12 and 11 o'clock positions. Remove the tube from engine and install protective closures.

(8) FOR THESE MODELS: 4152, 4156A, 4158
(Pre SB PW4ENG 75−116) Remove air shutoff valve signal tube assembly (lower) (AA21) as follows.

(a) FOR THESE MODELS: 4152, 4156A, 4158
Remove lockwire and disconnect the tube nuts from the turbine cooling air shutoff valve at approximately the 3 o'clock position and from the upper tube coupling rear of Flange J at approximately the 2 o'clock position.

(b) FOR THESE MODELS: 4152, 4156A, 4158
Remove bolt, nut, and clamp that attaches the tube to the bracket attached to flange of shutoff valve at approximately the 3 o'clock position. Remove the tube from engine and install protective closures.

(9) FOR THESE MODELS: 4152, 4156A, 4158
(Post SB PW4ENG 75−116) Remove air shutoff valve signal tube assembly (lower) (AA90) as follows.

(a) FOR THESE MODELS: 4152, 4156A, 4158
Remove lockwire and disconnect the tube nuts from the turbine cooling air shutoff valve at approximately the 3 o'clock position and from the check valve on the lower end of (AA89) tube coupling rear of Flange J at approximately the 2:30 o'clock position.

(b) FOR THESE MODELS: 4152, 4156A, 4158
Remove bolt, nut, and clamp that attaches the tube to the bracket attached to flange of shutoff valve at approximately the 3 o'clock position. Remove the tube from engine and install protective closures.

(10) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the air shutoff valve signal tube assembly (AA77) as follows.

(a) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the lockwire and disconnect the tube nuts from the turbine vane and blade cooling air valve at approximately the 3 o'clock position and from the (lower) air filter at approximately the 1 o'clock position on the HPC case.

(b) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the bolt, nut and clamp that attach the tube to the bracket attached to the flange of the turbine vane and blade cooling air valve at approximately the 3 o'clock position. Remove the tube from the engine and install protective covers.

(11) FOR THESE MODELS: 4152, 4156A, 4158
(Pre SB PW4ENG 75−102 and SB PW4ENG 75−116) Remove the air shutoff valve signal tube assembly (upper) (AA20) as follows.

(a) FOR THESE MODELS: 4152, 4156A, 4158
Remove bolts, nuts, and clamps that attach the tube to the Flange J brackets at approximately the 2, 12 and 11 o'clock positions. Remove the tube from the engine and install protective closures.

(12) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the turbine vane cooling air valve pressure tube (AA76) as follows.

(a) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the lockwire and disconnect the tube nuts from the (lower) air filter on the left side of the engine at approximately the 11 o'clock position and from the turbine vane cooling air valve at the 2 o'clock position on the HPC case.

(b) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the bolts, nuts and clamps that attach the tube to the brackets on Flange J at the 10, 11:30 and 1 o'clock positions.

(c) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the tube from the engine and install protective closures.

(13) FOR THESE MODELS: 4152, 4156A, 4158
(Post SB PW4ENG 75−85 and Pre SB PW4ENG 75−116) Remove the HPC air valve signal tube assembly (AA15) on the right side of the engine.

(a) FOR THESE MODELS: 4152, 4156A, 4158
Remove the lockwire and disconnect the tube nuts from the rear of the lower right air filter at approximately the 2 o'clock and from the HPC secondary flow control valve at approximately the 3:30 o'clock position forward of Flange J.

(b) FOR THESE MODELS: 4152, 4156A, 4158
Remove the bolt, nut and clamp that attach the tube to a bracket that is attached to the turbine cooling air shutoff valve flange. Remove the tube from the engine and install protection covers.

(14) FOR THESE MODELS: 4152, 4156A, 4158
(Post SB PW4ENG 75−116) Remove the HPC air valve signal tube assemblies (AA89) and (AA91) on the right side of the engine.

(a) FOR THESE MODELS: 4152, 4156A, 4158
Remove the lockwire and disconnect the (AA91) tube nuts from the tee at the lower end of the (AA89) signal tube at approximately the 2:30 o'clock position and from the HPC secondary flow control valve at approximately the 3:30 o'clock position forward of Flange J.

(b) FOR THESE MODELS: 4152, 4156A, 4158
Remove the lockwire and disconnect the (AA89) tube nut from the rear of the lower right air filter at approximately the 2 o'clock poition. Remove the check valve, if necessary, from the tee end of the tube.

(15) Remove the main bearing strainer element housing assembly as follows.

(a) Remove lockwire, plugs and adapters. Remove packings and discard. Install protective closures.

(b) FOR THESE MODELS: 4152, 4156A, 4158
(Pre SB PW4ENG 79−53) Remove the threaded insert from housing. Remove the packing from the insert and discard the packing. Install a protection cover.

(c) Remove the bolts that attach the strainer element in the housing and remove the element. Remove packing and discard.

(d) Remove bolts, washer, and bracket that attach the housing flange to the top of fuel/oil cooler at approximately the 9 o'clock position and remove the housing. Remove packing and discard.
